Protected Matters Search Tool Report

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 18-Sep-2025

Summary
Details
- Matters of NES
- Other Matters Protected by the EPBC Act
- Extra Information

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	None
Listed Threatened Ecological Communities:	7
Listed Threatened Species:	60
Listed Migratory Species:	26

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	254
Commonwealth Heritage Places:	None
Listed Marine Species:	30
Whales and Other Cetaceans:	None
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	16
Regional Forest Agreements:	1
Nationally Important Wetlands:	2
EPBC Act Referrals:	22
Key Ecological Features (Marine):	None
Biologically Important Areas:	None
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text	Buffer Status
Banksia Woodlands of the Swan Coastal Plain ecological community	Endangered	Community likely to occur within area	In feature area
Clay Pans of the Swan Coastal Plain	Critically Endangered	Community likely to occur within area	In buffer area only
Corymbia calophylla - Kingia australis woodlands on heavy soils of the Swan Coastal Plain	Endangered	Community known to occur within area	In buffer area only
Empodisma peatlands of southwestern Australia	Endangered	Community may occur within area	In feature area
Shrublands and Woodlands of the eastern Swan Coastal Plain	Endangered	Community known to occur within area	In buffer area only
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area	In buffer area only
Tuart (Eucalyptus gomphocephala) Woodlands and Forests of the Swan Coastal Plain ecological community	Critically Endangered	Community may occur within area	In feature area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text	Buffer Status
BIRD			
Botaurus poiciloptilus			
Australasian Bittern [1001]	Endangered	Species or species habitat likely to occur within area	In feature area
Calidris acuminata			
Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area	In feature area
Calyptorhynchus banksii naso Forest Red-tailed Black-Cockatoo, Karrak [67034]	Vulnerable	Species or species habitat known to occur within area	In feature area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat may occur within area	In buffer area only
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Leipoa ocellata Malleefowl [934]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In buffer area only
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In buffer area only
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area	In feature area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Phaethon rubricauda westralis Red-tailed Tropicbird (Indian Ocean), Indian Ocean Red-tailed Tropicbird [91824]	Endangered	Species or species habitat may occur within area	In buffer area only
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area	In feature area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Thalassarche cauta Shy Albatross [89224]	Endangered	Species or species habitat may occur within area	In buffer area only
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In buffer area only
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area	In feature area
Zanda baudinii listed as Calyptorhynchus baudinii Baudin's Cockatoo, Baudin's Black-Cockatoo, Long-billed Black-cockatoo [87736]	Endangered	Roosting known to occur within area	In feature area
Zanda latirostris listed as Calyptorhynchus latirostris Carnaby's Black Cockatoo, Short-billed Black-cockatoo [87737]	Endangered	Breeding known to occur within area	In feature area
INSECT			
Leioproctus douglasiellus a short-tongued bee [66756]	Critically Endangered	Species or species habitat may occur within area	In buffer area only
MAMMAL			

Scientific Name	Threatened Category	Presence Text	Buffer Status
Bettongia penicillata ogilbyi Woylie [66844]	Endangered	Species or species habitat may occur within area	In buffer area only
Dasyurus geoffroii Chuditch, Western Quoll [330]	Vulnerable	Species or species habitat known to occur within area	In feature area
Setonix brachyurus Quokka [229]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
OTHER			
Westralunio carteri Carter's Freshwater Mussel, Ambiguus Mussel [86266]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
PLANT			
Acacia anomala Grass Wattle, Chittering Grass Wattle [8153]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Acacia aphylla Leafless Rock Wattle [13553]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Andersonia gracilis Slender Andersonia [14470]	Endangered	Species or species habitat likely to occur within area	In feature area
Anigozanthos viridis subsp. terraspectans Dwarf Green Kangaroo Paw [3435]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Anthocercis gracilis Slender Tailflower [11103]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Banksia mimica Summer Honeypot [82765]	Endangered	Species or species habitat likely to occur within area	In feature area
Calytrix breviseta subsp. breviseta Swamp Starflower [23879]	Endangered	Species or species habitat likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Chamelaucium lullfitzii listed as Chamelaucium sp. Gingin (N.G.Marchant 6)			
Gingin Wax [92777]	Endangered (listed as Chamelaucium sp. Gingin	Species or species habitat may occur within area	In feature area
Conospermum undulatum			
Wavy-leaved Smokebush [24435]	Vulnerable	Species or species habitat known to occur within area	In feature area
Darwinia apiculata			
Scarp Darwinia [8763]	Endangered	Species or species habitat known to occur within area	In buffer area only
Diplolaena andrewsii			
[6601]	Endangered	Species or species habitat likely to occur within area	In feature area
Diuris drummondii			
Tall Donkey Orchid [4365]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Diuris micrantha			
Dwarf Bee-orchid [55082]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Diuris purdiei			
Purdie's Donkey-orchid [12950]	Endangered	Species or species habitat likely to occur within area	In feature area
Drakaea elastica			
Glossy-leafed Hammer Orchid, Glossy-leaved Hammer Orchid, Warty Hammer Orchid [16753]	Endangered	Species or species habitat likely to occur within area	In feature area
Drakaea micrantha			
Dwarf Hammer-orchid [56755]	Vulnerable	Species or species habitat may occur within area	In feature area
Eleocharis keigheryi			
Keighery's Eleocharis [64893]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Eremophila glabra subsp. chlorella			
[84927]	Endangered	Species or species habitat likely to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Eucalyptus x balanites			
Cadda Road Mallee, Cadda Mallee [87816]	Endangered	Species or species habitat may occur within area	In feature area
Grevillea curviloba subsp. incurva			
Narrow curved-leaf Grevillea [64909]	Endangered	Species or species habitat may occur within area	In feature area
Grevillea flexuosa			
Zig Zag Grevillea [2957]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Macarthuria keigheryi			
Keighery's Macarthuria [64930]	Endangered	Species or species habitat known to occur within area	In feature area
Morelotia australiensis listed as Tetraria australiensis			
Southern Tetraria [92784]	Vulnerable	Species or species habitat may occur within area	In feature area
Synaphea sp. Fairbridge Farm (D.Papenfus 696)			
Selena's Synaphea [82881]	Critically Endangered	Species or species habitat likely to occur within area	In feature area
Thelymitra dedmaniarum			
Cinnamon Sun Orchid [65105]	Endangered	Species or species habitat may occur within area	In feature area
Thelymitra stellata			
Star Sun-orchid [7060]	Endangered	Species or species habitat known to occur within area	In feature area
Trithuria occidentalis			
Swan Hydatella [42224]	Endangered	Species or species habitat likely to occur within area	In buffer area only
REPTILE			
Caretta caretta			
Loggerhead Turtle [1763]	Endangered	Species or species habitat known to occur within area	In buffer area only
Chelonia mydas			
Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Dermochelys coriacea			
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area	In buffer area only
Natator depressus			
Flatback Turtle [59257]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
SHARK			
Sphyrna lewini			
Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat likely to occur within area	In buffer area only

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text	Buffer Status
Migratory Marine Birds			
Apus pacificus			
Fork-tailed Swift [678]		Species or species habitat likely to occur within area	In feature area
Diomedea amsterdamensis			
Amsterdam Albatross [64405]	Endangered	Species or species habitat may occur within area	In buffer area only
Diomedea epomophora			
Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Diomedea exulans			
Wandering Albatross [89223]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Macronectes giganteus			
Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In buffer area only
Macronectes halli			
Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In buffer area only
Phaethon rubricauda			
Red-tailed Tropicbird [994]		Species or species habitat may occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Thalassarche cauta Shy Albatross [89224]	Endangered	Species or species habitat may occur within area	In buffer area only
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In buffer area only
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Migratory Marine Species			
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat known to occur within area	In buffer area only
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area	In buffer area only
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat may occur within area	In buffer area only
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat may occur within area	In buffer area only
Natator depressus Flatback Turtle [59257]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Migratory Terrestrial Species			
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Migratory Wetlands Species			
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area	In feature area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area	In feature area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area	In feature area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat likely to occur within area	In feature area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area	In feature area
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area	In feature area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area	In feature area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Commonwealth Land Name	State	Buffer Status

Listed Marine Species			[Resource Information]
Scientific Name	Threatened Category	Presence Text	Buffer Status
Bird			
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area	In feature area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area	In feature area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area	In feature area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area	In feature area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area overfly marine area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat likely to occur within area overfly marine area	In feature area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat may occur within area	In buffer area only
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat likely to occur within area	In feature area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In buffer area only
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In buffer area only
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area	In feature area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area overfly marine area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area	In feature area
Pachyptila turtur Fairy Prion [1066]		Species or species habitat likely to occur within area	In buffer area only
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area	In feature area
Phaethon rubricauda Red-tailed Tropicbird [994]		Species or species habitat may occur within area	In buffer area only
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area	In feature area
Thalassarche cauta Shy Albatross [89224]	Endangered	Species or species habitat may occur within area	In buffer area only
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In buffer area only
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Thinornis cucullatus as Thinornis rubricollis Hooded Plover, Hooded Dotterel [87735]		Species or species habitat likely to occur within area overfly marine area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area overfly marine area	In feature area
Reptile			
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat known to occur within area	In buffer area only
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area	In buffer area only
Natator depressus Flatback Turtle [59257]	Vulnerable	Species or species habitat known to occur within area	In buffer area only

Ridge Hill Road intersection modification and offsite water main installation, Gooseberry Hill, WA	2020/8842	Not Controlled Action	Completed	In buffer area only
Roe Highway Noise Wall, High Wycombe, WA	2014/7149	Not Controlled Action	Completed	In buffer area only
Tonkin Highway Upgrade, Guildford Road to Great Eastern Highway, WA	2019/8545	Not Controlled Action	Completed	In buffer area only
Not controlled action (particular manner)				
Commercial Estate and Aeronautical Infrastructure Development, Precincts 2A & 2B	2006/3021	Not Controlled Action (Particular Manner)	Post-Approval	In buffer area only
South West Metropolitan Railway Project	2003/1175	Not Controlled Action (Particular Manner)	Post-Approval	In buffer area only

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data is available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance on the contents of this report.

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions when time permits.

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded breeding sites; and
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

-Office of Environment and Heritage, New South Wales

APPENDIX 7

Conservation Codes

Conservation Codes for Western Australian Flora and Fauna

Threatened, Extinct and Specially Protected fauna or flora are species which have been adequately searched for and are deemed to be, in the wild, threatened, extinct or in need of special protection, and have been gazetted as such.

The lists of Threatened, Extinct and Specially Protected species are listed under Part 2 of the Biodiversity Conservation Act 2016.

Categories of Threatened, Extinct and Specially Protected fauna and flora are:

T Threatened species

Listed by order of the Minister as Threatened in the category of critically endangered, endangered or vulnerable under section 19(1), or is a rediscovered species to be regarded as threatened species under section 26(2) of the *Biodiversity Conservation Act 2016* (BC Act).

> ***Threatened fauna*** is the species of fauna that are listed as critically endangered, endangered or vulnerable threatened species.
>
> ***Threatened flora*** is the species of flora that are listed as critically endangered, endangered or vulnerable threatened species.

The assessment of the conservation status of threatened species is in accordance with the BC Act listing criteria and the requirements of Ministerial Guideline (Number 1) and Ministerial Guideline (Number 2) that adopts the use of the International Union for Conservation of Nature (IUCN) Red List of Threatened Species Categories and Criteria 4, and is based on the national distribution of the species.

CR Critically endangered species

> Threatened species considered to be "*facing an extremely high risk of extinction in the wild in the immediate future, as determined in accordance with criteria set out in the ministerial guidelines*".
>
> Listed as critically endangered under section 19(1)(a) of the BC Act in accordance with the criteria set out in section 20 and the ministerial guidelines.

EN Endangered species

> Threatened species considered to be "*facing a very high risk of extinction in the wild in the near future, as determined in accordance with criteria set out in the ministerial guidelines*".
>
> Listed as endangered under section 19(1)(b) of the BC Act in accordance with the criteria set out in section 21 and the ministerial guidelines.

VU Vulnerable species

> Threatened species considered to be "*facing a high risk of extinction in the wild in the medium-term future, as determined in accordance with criteria set out in the ministerial guidelines*".

Listed as vulnerable under section 19(1)(c) of the BC Act in accordance with the criteria set out in section 22 and the ministerial guidelines.

Extinct Species

EX Presumed extinct species

Species where "*there is no reasonable doubt that the last member of the species has died*", and listing is otherwise in accordance with the ministerial guidelines (section 24 of the BC Act).

EW Extinct in the wild species

Species that "*is known only to survive in cultivation, in captivity or as a naturalised population well outside its past range; and it has not been recorded in its known habitat or expected habitat, at appropriate seasons, anywhere in its past range, despite surveys over a time frame appropriate to its life cycle and form*", and listing is otherwise in accordance with the ministerial guidelines (section 25 of the BC Act).

Currently there are no threatened fauna or threatened flora species listed as extinct in the wild. If listing of a species as extinct in the wild occurs, then a schedule will be added to the applicable notice.

Specially protected species

Listed by order of the Minister as specially protected under section 13(1) of the BC Act. Meeting one or more of the following categories: species of special conservation interest; migratory species; cetaceans; species subject to international agreement; or species otherwise in need of special protection.

Species that are listed as threatened species (critically endangered, endangered or vulnerable) or extinct species under the BC Act cannot also be listed as Specially Protected species.

MI Migratory species

Fauna that periodically or occasionally visit Australia or an external Territory or the exclusive economic zone; or the species is subject of an international agreement that relates to the protection of migratory species and that binds the Commonwealth; and listing is otherwise in accordance with the ministerial guidelines (section 15 of the BC Act).

Includes birds that are subject to an agreement between the government of Australia and the governments of Japan (JAMBA), China (CAMBA) and The Republic of Korea (ROKAMBA), and fauna subject to the Convention on the Conservation of Migratory Species of Wild Animals (Bonn Convention), an environmental treaty under the United Nations Environment Program. Migratory species listed under the BC Act are a subset of the migratory animals, that are known to visit Western Australia, protected under the international agreements or treaties, excluding species that are listed as Threatened species.

CD Species of special conservation interest (conservation dependent fauna)

Fauna of special conservation need being species dependent on ongoing conservation intervention to prevent it becoming eligible for listing as threatened, and listing is otherwise in accordance with the ministerial guidelines (section 14 of the BC Act).

Currently only fauna are listed as species of special conservation interest.

OS Other specially protected species

Fauna otherwise in need of special protection to ensure their conservation, and listing is otherwise in accordance with the ministerial guidelines (section 18 of the BC Act).

Currently only fauna are listed as species otherwise in need of special protection.

P Priority species

Priority is not a listing category under the BC Act.

All fauna and flora are protected in WA following the provisions in Part 10 of the BC Act. The protection applies even when a species is not listed as threatened or specially protected, and regardless of land tenure (State managed land (Crown land), private land, or Commonwealth land).

Species that may possibly be threatened species that do not meet the criteria for listing under the BC Act because of insufficient survey or are otherwise data deficient, are added to the Priority Fauna or Priority Flora Lists under Priorities 1, 2 or 3. These three categories are ranked in order of prioritisation for survey and evaluation of conservation status so that consideration can be given to potential listing as threatened.

Species that are adequately known, meet criteria for near threatened, or are rare but not threatened, or that have been recently removed from the threatened species list or conservation dependent or other specially protected fauna lists for other than taxonomic reasons, are placed in Priority 4. These species require regular monitoring.

Assessment of priority status is based on the Western Australian distribution of the species, unless the distribution in WA is part of a contiguous population extending into adjacent States, as defined by the known spread of locations.

Priority 1: Poorly-known species

Species that are known from one or a few locations (generally five or less) which are potentially at risk. All occurrences are either: very small; or on lands not managed for conservation, for example, agricultural or pastoral lands, urban areas, road and rail reserves, gravel reserves and active mineral leases; or otherwise under threat of habitat destruction or degradation.

Species may be included if they are comparatively well known from one or more locations but do not meet adequacy of survey requirements for threatened listing and appear to be under immediate threat from known threatening processes. These species are in urgent need of further survey.

Priority 2: Poorly-known species

Species that are known from one or a few locations (generally five or less), some of which are on lands managed primarily for nature conservation, for example, national parks, conservation parks, nature reserves and other lands with secure tenure being managed for conservation.

Species may be included if they are comparatively well known from one or more locations but do not meet adequacy of survey requirements for threatened listing and appear to be under threat from known threatening processes. These species are in urgent need of further survey.

Priority 3: Poorly-known species

Species that are known from several locations and the species does not appear to be under imminent threat or from few but widespread locations with either large population size or significant remaining areas of apparently suitable habitat, much of it not under imminent threat.

Species may be included if they are comparatively well known from several locations but do not meet adequacy of survey requirements and known threatening processes exist that could affect them. These species need further survey.

Priority 4: Rare, Near Threatened and other species in need of monitoring

(a) Rare. Species that are considered to have been adequately surveyed, or for which sufficient knowledge is available, and that are considered not currently threatened or in need of special protection but could be if present circumstances change. These species are usually represented on conservation lands.

(b) Near Threatened. Species that are considered to have been adequately surveyed and that are close to qualifying for vulnerable but are not listed as a conservation dependent specially protected species.

(c) Species that have been removed from the list of threatened species or lists of conservation dependent or other specially protected species, during the past five years for reasons other than taxonomy.

(d) Other species in need of monitoring.

Western Australian Ecological Communities

<u>Threatened Ecological Communities</u>

The BC Act provides for the statutory listing of threatened ecological communities (TECs) by the Minister.

Presumed Totally Destroyed (PD)

An ecological community that has been adequately searched for but for which no representative occurrences have been located. The community has been found to be totally

destroyed or so extensively modified throughout its range that no occurrence of it is likely to recover its species composition and/or structure in the foreseeable future.

Critically Endangered (CR)

An ecological community that has been adequately surveyed and found to have been subject to a major contraction in area and/or that was originally of limited distribution and is facing severe modification or destruction throughout its range in the immediate future, or is already severely degraded throughout its range but capable of being substantially restored or rehabilitated.

Endangered (EN)

An ecological community that has been adequately surveyed and found to have been subject to a major contraction in area and/or was originally of limited distribution and is in danger of significant modification throughout its range or severe modification or destruction over most of its range in the near future.

Vulnerable (VU)

An ecological community that has been adequately surveyed and is found to be declining and/or has declined in distribution and/or condition and whose ultimate security has not yet been assured and/or a community that is still widespread but is believed likely to move into a category of higher threat in the near future if threatening processes continue or begin operating throughout its range.

Priority Ecological Communities

Possible threatened ecological communities that do not meet survey criteria or that are not adequately defined are added to the Priority Ecological Community List under priorities 1, 2 and 3. These three categories are ranked in order of priority for survey and/or definition of the community. Ecological communities that are adequately known, and are rare but not threatened or meet criteria for Near Threatened, or that have been recently removed from the threatened list, are placed in Priority 4. These ecological communities require regular monitoring. Conservation Dependent ecological communities are placed in Priority 5.

Priority One: Poorly-known ecological communities

Ecological communities that are known from very few occurrences with a very restricted distribution (generally ≤5 occurrences or a total area of ≤ 100ha).

Occurrences are believed to be under threat either due to limited extent, or being on lands under immediate threat (e.g. within agricultural or pastoral lands, urban areas, active mineral leases) or for which current threats exist. May include communities with occurrences on protected lands. Communities may be included if they are comparatively well-known from one or more localities but do not meet adequacy of survey requirements, and/or are not well defined, and appear to be under immediate threat from known threatening processes across their range.

Priority Two: Poorly-known ecological communities

Communities that are known from few occurrences with a restricted distribution (generally ≤10 occurrences or a total area of ≤200ha). At least some occurrences are not believed to be under immediate threat (within approximately 10 years) of destruction or degradation. Communities may be included if they are comparatively well known from one or more localities but do not meet adequacy of survey requirements, and/or are not well defined, and appear to be under threat from known threatening processes.

Priority Three: Poorly known ecological communities

(i) Communities that are known from several to many occurrences, a significant number or area of which are not under threat of habitat destruction or degradation or:

(ii) communities known from a few widespread occurrences, which are either large or with significant remaining areas of habitat in which other occurrences may occur, much of it not under imminent threat (within approximately 10 years), or;

(iii) munities made up of large, and/or widespread occurrences, that may or may not be represented in the reserve system, but are under threat of modification across much of their range from processes such as grazing by domestic and/or feral stock, inappropriate fire regimes, clearing, hydrological change etc.

Communities may be included if they are comparatively well known from several localities but do not meet adequacy of survey requirements and/or are not well defined, and known threatening processes exist that could affect them.

Priority Four: Ecological communities that are adequately known, rare but not threatened or meet criteria for Near Threatened, or that have been recently removed from the threatened list. These communities require regular monitoring.

(i) Rare. Ecological communities known from few occurrences that are considered to have been adequately surveyed, or for which sufficient knowledge is available, and that are considered not currently threatened or in need of special protection, but could be if present circumstances change. These communities are usually represented on conservation lands.

(ii) Near Threatened. Ecological communities that are considered to have been adequately surveyed and that do not qualify for Conservation Dependent, but that are close to qualifying for a higher threat category.

(iii) Ecological communities that have been removed from the list of threatened communities during the past five years.

Priority Five: Conservation Dependent ecological communities

Ecological communities that are not threatened but are subject to a specific conservation program, the cessation of which would result in the community becoming threatened within five years.

Commonwealth of Australia Conservation Codes

Threatened Flora and Fauna

Threatened fauna and flora may be listed under Section 178 of the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) in any one of the following six categories:

Extinct

A native species is eligible to be included in the extinct category at a particular time if, at that time, there is no reasonable doubt that the last member of the species has died.

Extinct in the wild

A native species is eligible to be included in the extinct in the wild category at a particular time if, at that time:

a) it is known only to survive in cultivation, in captivity or as a naturalised population well outside its past range; or
b) it has not been recorded in its known and/or expected habitat, at appropriate seasons, anywhere in its past range, despite exhaustive surveys over a time frame appropriate to its life cycle and form.

Critically endangered

A taxon is Critically Endangered when the best available evidence indicates that it meets any of the five criteria for the category identified in Part 7.01 of the EPBC Regulations, and it is therefore considered to be facing an extremely high risk of extinction in the wild.

Endangered

A taxon is Endangered when the best available evidence indicates that it meets any of the five criteria for the category identified in Part 7.01 of the EPBC Regulations, and it is therefore considered to be facing a very high risk of extinction in the wild.

Vulnerable

A taxon is Vulnerable when the best available evidence indicates that it meets any of the five criteria for the category identified in Part 7.01 of the EPBC Regulations, and it is therefore considered to be facing a high risk of extinction in the wild.

Conservation dependent

A native species is eligible to be included in the conservation dependent category at a particular time if, at that time:

a) the species is the focus of a specific conservation program the cessation of which would result in the species becoming vulnerable, endangered or critically endangered; or
b) the following subparagraphs are satisfied:
    i. the species is a species of fish;

ii. the species is the focus of a plan of management that provides for management actions necessary to stop the decline of, and support the recovery of, the species so that its chances of long term survival in nature are maximised;
iii. the plan of management is in force under a law of the Commonwealth or of a State or Territory;
iv. cessation of the plan of management would adversely affect the conservation status of the species.

The EPBC Act does not provide for listing in a data deficient category. Where sufficient data (evidence) is unavailable to allow assessment by the Threatened Species Scientific Committee against the criteria for listing, the species are found to be ineligible. A recommendation is made to the Minister to not include the species in any category under the EPBC Act. For reasons of transparency and to inform future research, the Threatened Species Scientific Committee publishes the names of those species found to be data deficient. As data deficient is not a listing category under the EPBC Act, this has no statutory implications and the species is not considered to be listed under the EPBC Act.

Threatened Ecological Communities

Threatened Ecological communities under the EPBC Act are listed in three categories.

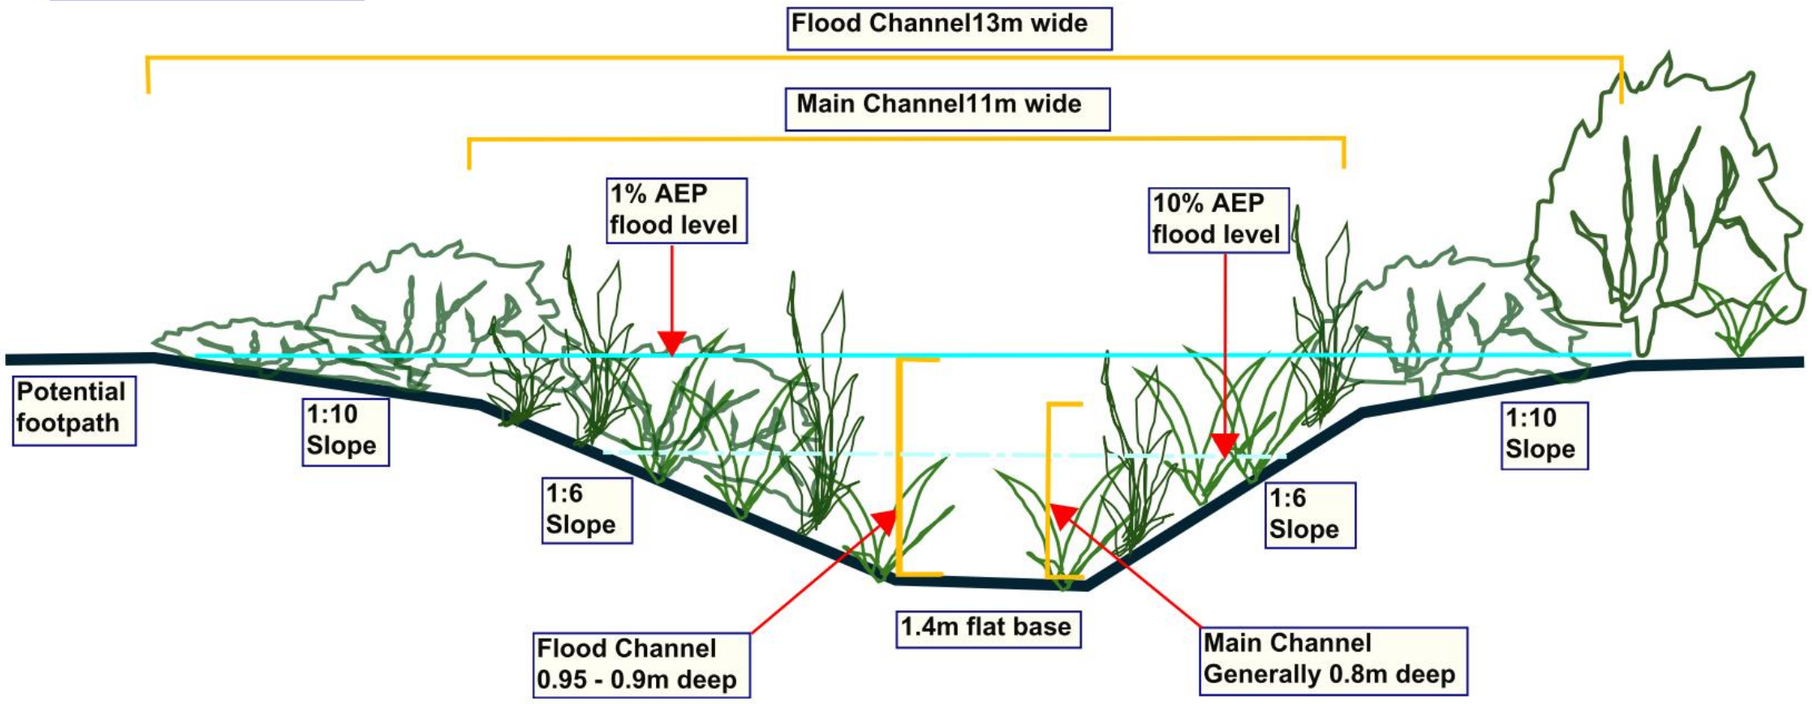
Critically endangered

If, at that time, an ecological community is facing an extremely high risk of extinction in the wild in the immediate future (indicative timeframe being the next 10 years).

Endangered

If, at that time, an ecological community is not critically endangered but is facing a very high risk of extinction in the wild in the near future (indicative timeframe being the next 20 years).

Vulnerable



If, at that time, an ecological community is not critically endangered or endangered, but is facing a high risk of extinction in the wild in the medium–term future (indicative timeframe being the next 50 years).

Appendix G LWMS CHECKLIST

Appendix 2 Local water management strategy checklist

Local water management strategy item	Comment/Location	Achieved
Executive summary		
Summary of the development design strategy, outlining how the design objectives are proposed to be met	Executive Summary - Pg1 and Section 2 Key Elements Pg 3,4	
Introduction		
Total water-cycle management – principles and objectives Planning background Previous studies	Section 2 Key Elements Pg 3,4 Executive Summary – 1.1 Planning Summary & Referencing Document listed in each section plus Section 14 Reference summary Pg 39	
Proposed development		
Structure plan, zoning and land use Key landscape features Previous land use	Executive Summary – Site Summary & Planning Summary Pg2	
Landscape – proposed public open space areas, public open space credits, water source, bore(s), lake details, irrigation areas (if applicable)	Executive Summary – Site Summary & Planning Summary Pg2 plus Section 2 Fig 3 Pg 4. Section 10 Water Dependent Ecosystems Management Strategy, Section11 for irrigation options	
Design criteria		
Agreed design objectives and source of objectives	Section 2 Key Elements Pg 3,4 Plus Sections 8-11for more detail	
Existing information and more detailed assessments (monitoring). How do the site characteristics affect the design?	Existing Information Sections 3-7 for current conditions. Sections 8-11 for how these characteristics and managed.	
Site conditions – existing topography/contours, aerial photo underlay, major physical features	Section 3	
Geotechnical – topography, soils including acid sulfate soils and infiltration capacity, test pit locations	Section 5	
Environmental – areas of significant flora and fauna, wetlands and buffers, waterways and buffers, contaminated sites	Section 4	
Surface water – topography, 100- year floodways and flood fringe areas, water quality of flows entering and leaving (if applicable)	Section 7	
Groundwater – topography, pre- development groundwater levels and water quality, test bore locations	Section 6	
Water sustainability initiatives		
Water efficiency measures – private and public open spaces including method of enforcement	Section 11	
Water supply (fit-for-purpose) strategy, agreed actions and implementation	Section 11	
Wastewater management	Section 11	

Stormwater management strategy		
Flood protection – peak flow rates, volumes and top water levels at control points, 100-year flowpaths and100-year detention storage areas	Section 8, especially sub Section 8.3, 8.7 and 8.8	
Manage serviceability – storage and retention required for the critical 5- year ARI storm events Minor roads should be passable in the 5-year ARI event	Section 8 especially sub Section 8.5, 8.6	
Protect ecology – detention areas for the 1-year 1-hour ARI event, areas for water quality treatment and types of agreed structural and non-structural best management practices and treatment trains (including indicative locations). Protection of waterways, wetlands (and their buffers), remnant vegetation and ecological linkages	Section 8 especially sub Section 8.4 Section10	
Groundwater management strategy		
Post-development groundwater levels, existing and likely final surface levels, outlet controls, and subsoil drain areas/exclusion zones	Section 9.1	
Actions to address acid sulfate soils or contamination	Section 9.2	
The next stage – subdivision and urban water management plans		
Content and coverage of future urban water management plans to be completed at subdivision. Include areas where further investigations are required before detailed design.	Section 13	
Monitoring		
Recommended future monitoring plan including timing, frequency, locations and parameters, together with arrangements for ongoing actions	Section 12	
Implementation		
Developer commitments	Section 13	
Roles, responsibilities, funding for implementation	Section 13	
Review	Section 13

Understanding your Report

1. INTRODUCTION

This revised report presents the outcomes of Galt Geotechnics' (Galt's) general site and soil evaluation (SSE) for the proposed Hatch Court Light Industrial Area (HCLIA) and Stirling Crescent Precinct (SCP), at Hatch Court and Stirling Crescent, High Wycombe ("the site"). This revision addresses client queries.

This report is to be read in conjunction with the appended "Requirements and Limitations" found at the back of this report.

2. DEFINITIONS

Site and Soil Evaluation (SSE): an assessment of all relevant constraints and the risks to public health and the environment in accordance with AS1547-2012 "On-site domestic wastewater management". This SSE is a general assessment SSE, with the purpose being to undertake a site suitability assessment for onsite wastewater management and to recommend the type of onsite wastewater system for the proposed development.

A specific assessment is required to support an "application to install" an onsite wastewater system. This is for when a particular type of system/model is proposed, and a detailed design, including management recommendations and operation requirements. This document is not a specific assessment.

Land Application Area (LAA): The unencumbered plan area to which treated sewage from an on-site sewage system is distributed for further in-soil treatment and absorption or evaporation. This area is restricted to the distribution of treated sewage and may not be developed for other purposes.

Land Application System (LAS): The system used to apply effluent from a wastewater treatment unit into or onto the soil for further in-soil treatment and absorption or evaporation.

Effluent: The liquid discharged from a wastewater treatment unit.

Primary Treatment: The separation of suspended material from sewage in septic tanks, primary settling chambers or other structures before discharge to either a LAS or secondary treatment process.

Secondary Treatment: Microbiological digestions and physical settling and filtering processes and decomposition of sewage constituents following primary treatment.

Sewage: Any kind of sewage, faecal matter or urine, and any waste composed wholly or in part of liquid.

Infiltrative Area: Is the area within an LAA that has treated effluent directly discharged onto, and does not include setback areas. I.e., the base of leach drains, evapotranspiration beds etc.

3. GOVERNING STANDARDS, REGULATIONS AND POLICIES

SSEs are governed by various National and State Standards, Regulations and Policies, including:

- AS/NZS 1547:2012, On-site domestic wastewater management.
- Western Australia Health (Treatment of Sewage and Disposal of Effluent and Liquid Waste) Regulations (1974)
- Western Australia State Planning Policy 2.9, Water Resources (2025)
- Western Australia Environmental Protection Act 1986 Part V (prescribed premises)
- Western Australia Contaminated Sites Act (2003)
- Department of Water and Environmental Regulation (DWER) acid sulfate soils guidance and risk mapping
- City of Kalamunda Design Guidelines for sewage only on site systems and water sensitive urban design

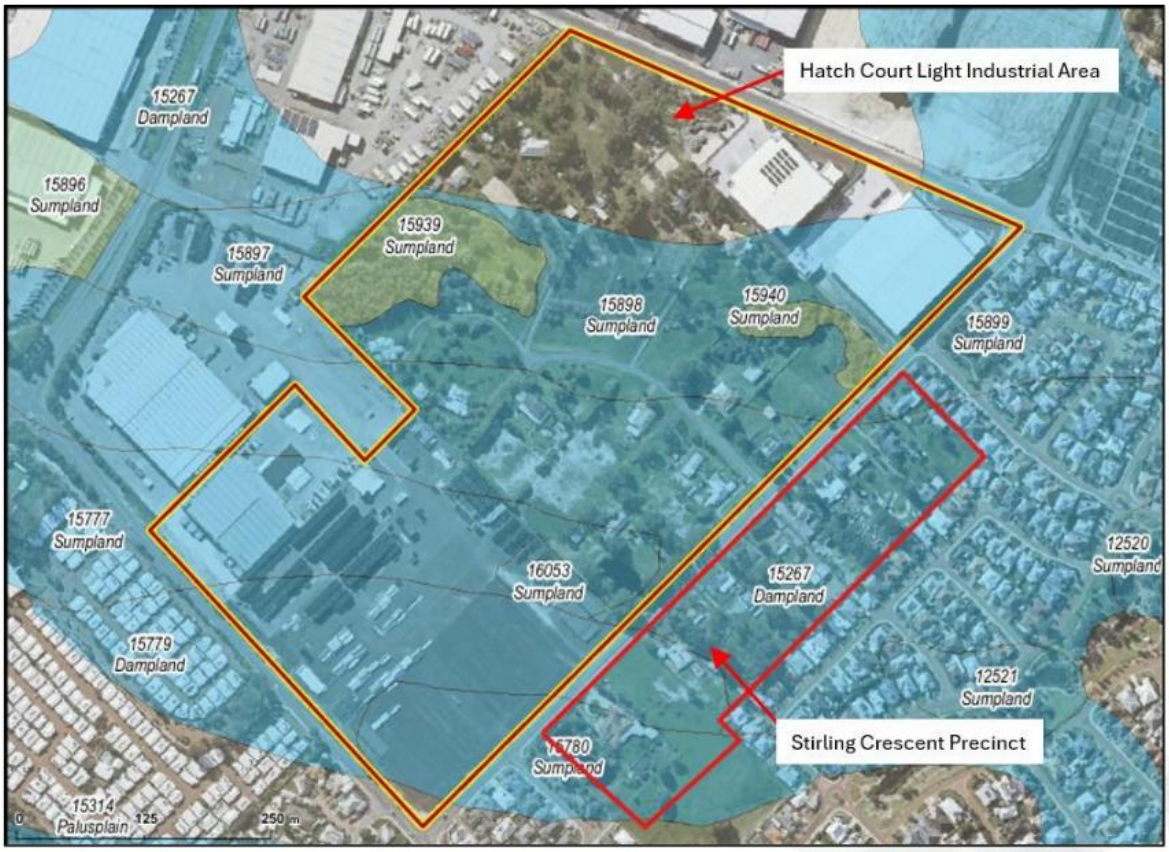
Other regulatory requirements may become relevant depending on the outcomes of any SSE.

SSEs can be rejected on the basis of not meeting the regulatory requirements of the above. This report is intended to address all these various requirements.

4. SITE DESCRIPTION

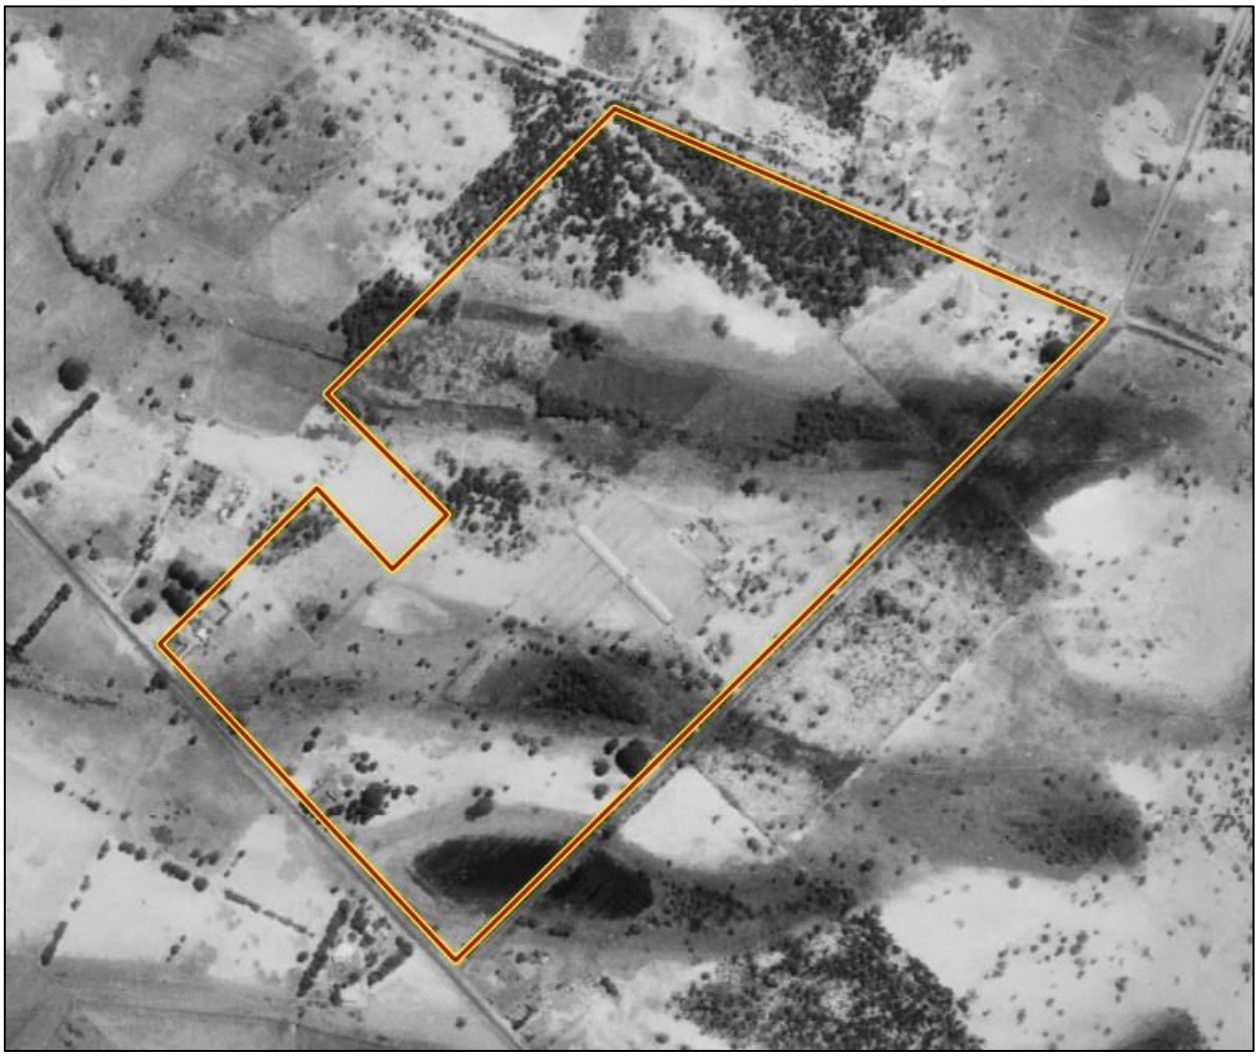
Table 1: Summary of Site

Item	Comment
Site Extent	Refer to In-line Image 1.
Site Area	Hatch Court Light Industrial Area (HCLIA): ~30 ha (16 lots). Stirling Crescent Precinct (SCP): ~6 ha (11 lots).
Current Site Surface Elevation[1]	Around RL 20 m AHD at the north to RL 24 m AHD at the south.
Vegetation	Vegetation present in landscaped areas surrounding houses and associated infrastructure. Vegetation includes grassed areas, some mature trees and some bushes (refer Figure 1). Dense vegetation along drainage line in northern part of site.
DBCA Wetlands	AS shown on In-Line Image 2, indicating that most of the site is a sewage sensitive area.
PDWSA's	None
Current Land Use	Mostly Residential developments and associated infrastructure. South west part of site (Lots 614 and 584) is a hardstand area (refer Figure 1). Some lots have been developed for light industrial use.
Site drainage	Drainage line traverses from west to east in northern part of site. Wetland area present in western corner of site near Lewis Road. Several damp lands are apparent from historical aerial photos (refer In-line Image 2 and 3) which could possibly have been filled. Localised lakes are present in southern part of site, which are judged to be expressions of groundwater. The above features are indicated on Inline Image 1.
Site History[2]	**Prior to 1979**: Site mostly pastoral / agricultural land. Three residences developed on site. **1979 to 1983**: Development of residential buildings in SCP. **1983 to 1995**: Development of Hatch Court. And associated residential lots / developments. **1995 to 2018**: Site relatively unchanged. Some additional residential and light industrial buildings and associated infrastructure constructed progressively during this time. **2018**: to Construction of hardstand in western corner of site. **2018 to 2024**: progressive construction of hardstand in western part of site (Lots 614 and 584).



NOTES:

1. *Site levels based on survey information provided.*



2. *Site history based on aerial imagery (Landgate).*

In-line Image 1: Approximate extent of subject area

In-line Image 2: Approximate extent of subject area and geomorphic wetlands mapped by DBCA (green and blue)

In-line Image 3: Aerial photo of site in 1961. HCLA marked in red/yellow.

5. PROPOSED DEVELOPMENT

Table 2: Summary of Proposed Development

Item	Comment
Proposed Development	Subdivision of industrial lots with associated infrastructure / development.
Cut/Fill	Assumed typically up to about ± 1 m. Fill is generally anticipated to be required in low lying areas to achieve adequate clearance to groundwater.
Assumed Retaining Walls	Gravity walls up to about 2 m high
Assumed Stormwater Disposal	Possibly On site via soakwells.
Assumed Sewage Disposal[1]	On site via leach drains within individual lots of proposed subdivision.[1]

NOTE: ***1.*** *Any onsite systems (if used) serve staff amenities sewage only. Trade/process liquids and wash down water must not infiltrate to ground or enter onsite systems (Refer Section 8.7.13 of SPP-2025).*

6. PRELIMINARY HYDRAULIC LOADING

No preliminary hydraulic loading is available at this stage. We have assumed a preliminary hydraulic loading of about 5,000 L/day per lot, but could possibly range from about 2,500 L/day to 7,500 L/day based on individual lot development requirements. The LAA within each lot will need to be resized based on the actual hydraulic loading.

Hydraulic loading must be calculated in accordance with "Supplement to Regulation 29 – Wastewater system loading rates". The proposed LAA must also be adequately sized to meet the zero effluent storage and Government Sewerage Policy (2019) design requirements. We have assumed that any industrial liquid waste or washdown water is to be disposed off site (and not into the LAA).

The governing LAA area is the larger of SPP conversion factor or the water balance (Refer Section 12.3). Lot sizing will be revisited at DA/application stage prior to installation.

7. PREVIOUS STUDIES

Galt has previously undertaken a number of geotechnical studies for individual lots within and adjacent the sites as summarised below:

- **Located within site:**
  - 27 Hatch Court in May 2025 (report reference: WAG250256-01 001 R Rev1);
  - Lots 8 and 16 Stirling Crescent in November 2024 (report reference: WAG240438-01 001 R Rev2);
- ***located north of site / not within site:***
  - 71 Stirling Crescent in March 2023 (report reference: WAG230133-01 001 R Rev1); and
  - Part of Lot 1499 Stirling Crescent in September 2023 (report reference: WAG230463-01 002 R Rev1).

Test locations from the above reports are shown on Figure 1 and summarised in Attached Tables 9 and 10. Relevant information from the above studies are incorporated into this report.

8. FIELDWORK

8.1. Summary

Fieldwork was carried out in the presence of a representative from Galt on 25 August and 5 September 2025 as summarised below.

Table 3: Summary of Field Data

Type	Results Appendix	Summary	Equipment Used	No. Tests	Depth Range (m)
Site Plan	Figure 1	-	Hand held GPS[1]	-	-
Photographs	A	-	-	-	-
Cone Penetration Tests (CPTs)	B	Section 11	Pagani TG 73-200	16	2.34 to 5.20
Boreholes (BH)	C	Section 11	EVH Scout on utility / 7822DT / Hand Auger	14	1.30 to 3.00
Monitoring Wells (MW)	C	Section 8.3	7822DT	3[2]	3.00
Constant Head Permeameter Tests (G)	D	Section 8.2	Guelph Permeameter	7	0.38 to 0.57

NOTES:

1. *Hand held GPS is accurate to ±5 m. Test location coordinates and inferred elevations from a provided feature survey are presented as Attached Table 8.*
2. *Constant head Guelph Permeameter tests were carried out in hand-auger boreholes in accordance with Appendix G of AS 1547 (2012) "On-site domestic wastewater management".*
3. *One groundwater monitoring well location was unavailable for sampling after installation.*

8.2. Permeability Test Results

8.3. Groundwater Monitoring Wells

Groundwater monitoring wells were installed in boreholes drilled Geoprobe 6620 DT drill rig supplied and operated by Direct Push Probing.

Wells were constructed using 50 mm, class 18 flush-threaded PVC with a 2.5 m screened interval was installed at the base of each well and finished with approximate 0.6 to 0.7 m solid section extending to the surface. Refer to Appendix C for more information on construction details for each well.

A submersible pump was used to remove fine sediments and filter sand from the well. Groundwater levels were measured more than 7 days after installation and development to allow the water in the well to reach hydrostatic levels.

9. LABORATORY TESTING

Geotechnical and chemical laboratory testing of soil samples was undertaken by Western Geotechnical and Laboratory Services (WGLS) and Envirolab Services (WA) at their NATA accredited laboratories. Laboratory test results along with the test methods followed are presented in Appendix F and summarised in Attached Tables 1 and 2.

Chemical test results from previous studies are also included in Attached Table 2.

10. SITE CONDITIONS

10.1. Geology

Table 6: Summary of Geology Mapping

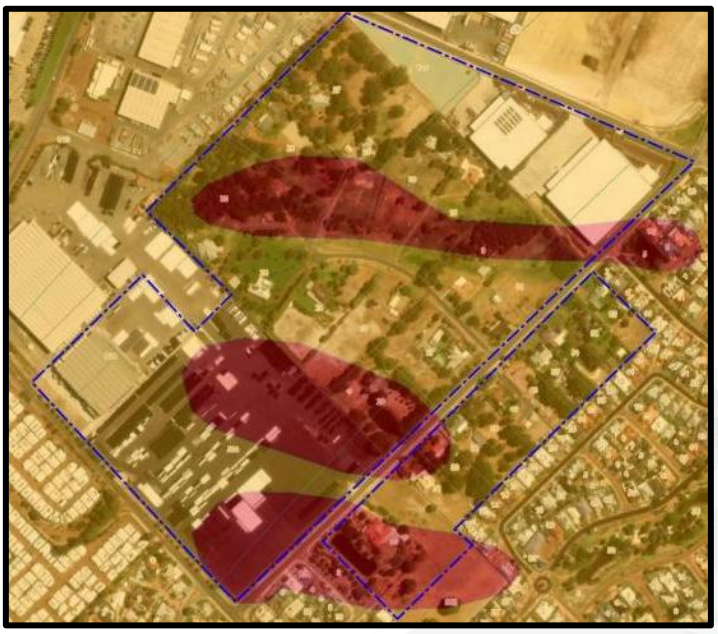
Map Sheet	Map Scale	Mapped Soils
Perth	1:50,000	Refer In-Line Image 3 for distribution of following units: - **Cps**: Peaty CLAY: "*dark grey and black with variable sand content of lacustrine origin [Swamp Deposits (Qhw)]*" - **S8**: Bassendean SAND: "*very light grey at surface, yellow at depth, fine to medium-grained, sub-rounded quartz, moderately well sorted of eolian origin*" - **S10**: "*Thin Bassendean Sand over Guildford formation*"

***NOTE**: Encountered subsurface profile discussed in Section 11.*

Inline Image 1: Excerpt from Perth 1:50,000 scale environmental geology map. HCLA marked in red/yellow

10.2. Groundwater and Surface Water

Table 7: Summary of Groundwater and Surface Water Levels



Item	Date	Depth Range (m)	Elevation Range (m AHD)	Comment
Perth Groundwater Atlas	2004	-	North: 13 South: 15	Inferred from levels measured in monitoring wells near the end of summer in 2004 only.
	2019		North west: 15.0 to 17.0 South east: 18.5 to 19.5	Inferred from maximum and minimum levels measured in monitoring wells in 2019 only.
DBCA Mapping	-	-	-	Most of the site are mapped as "Sumpland/Dampland", defined as a seasonally inundated/waterlogged area.
Site observations	Aug/Sept 2025	-	Surface to > 3 (Refer Attached Tables 3 to 7)	Groundwater also observed in lakes in southern part of site, and along drainage line in northern part of site. Groundwater could perch on underlying clay / clayey soils at the site.
Recommended Design	-	-	-	Design groundwater levels for the site must be assessed by a suitably qualified civil engineer and / or hydrologist. Filling of the site to gain separation to groundwater levels will be needed. Possibly, subsoil drains may be required.

NOTES: ***1.*** *Perth Groundwater Atlas observations based on monitoring wells which are not located at the site.*

2. *Elevation range for site observations is based on depth and site levels during fieldwork*

10.3. Acid Sulfate Soils

According to the DWER online ASS risk database, the proposed site is generally mapped as being within an area of 'moderate to low' ASS risk (highlighted in yellow in In-line Image 4 below) , with part of the site identified as having 'high to moderate' risk (highlighted in red in In-line Image 4 below) within the upper 3 m of the soil profile. High risk areas are judged to be associated with potential organic soils mapped in these areas (refer Section 10.1).

In-line Image 4: ASS Risk Mapping (DWER Database)

11. GROUND MODEL

The encountered subsurface conditions are summarised in Attached Tables 3 to 7, ad can be generalised as follows:

Most of Site (HCLIA and SCP):

- Surficial Topsoil / Hardstand / Sand Fill Layers; over
- **SAND (SP / SP-SM)**: fine to medium grained, sub angular to sub rounded, typically grey, typically trace fines, typically loose to depths of about 0.5 m to 2.5 m and then becomes typically medium dense, extending to depths of 2.0m to over 6.2 m; with
  - **Interbedded layers of cemented sand / 'Coffee Rock'**: encountered at some locations as cemented layer of sand typically with a higher fines content (i.e. Silty SAND in some zones) about 0.3 m to 1.0 m thick (where penetrated) and below about 2.0 m to 3.4 m depth (refer Attached Tables 3 to 7 for locations encountered). Coffee rock inferred from CPT refusal at some locations. Associated uncemented zones of discoloured brown / black sand with a higher fines content were also encountered in some locations. Layer underlain by sand; over
- **Guildford Formation interbedded CLAY / Clayey SAND / Sandy CLAY / SAND Layers (SP/SC/CL-CH)**: typically stiff to hard cohesive layers and medium dense sand layers, locations of encountered Guildford Formation summarised in Attached Tables 3 to 7.

HCLIA only: within / adjacent drainage line and wetland area[1]:

Variable organic soils were encountered as follows:

- **CPT01**: Possible inferred organic soil layer from 0.9 m to 1.2 m depth;
- **BH02**: Trace organics in Clayey SAND from 0.9 m to 2.0 m depth;
- **BH04**: Organic Clayey SAND from 0.7 m to 1.4 m depth
- **BH13/MW01**: PEAT from 0.0 m to 0.6 m depth, and then Organic SAND from 0.6 m to 1.4 m depth.

Notes:

- [1] Drainage line traverses from west to east in northern part of HCLIA site (refer Figure 1). Wetland area present in western corner of site near Lewis Road. Similar zones of organic soils could be present in lakes at the site (Refer Table 1).
- [2] An area of surficial uncontrolled fill about 1.1 m thick was encountered in the northern corner of the HCLIA site at 27 Hatch Court (refer Galt report referenced: WAG250256-01 001 R Rev1);

12. SITE ASSESSMENT

12.1. General

The results of our site assessment are presented in Attached Table 3.

12.2. Horizontal Setbacks

Table 8: Required Horizontal Setback Distances (AS1547)

Feature	Sub-Type	Horizontal Setback Distances (m)
Treatment tanks to buildings, property boundaries, driveways, paths and other tanks	-	1.2
Trenches, beds and soak wells to boundary, building, tanks and other land application systems	-	1.8
Trenches, beds and soak wells to trafficable areas	-	1.2
Any land application system to wells, streams, private bores or underground source of water intended for human consumption	-	30.0
Trenches, beds and soak wells to subsoil drains or open drainage channels	-	6.0
Spray irrigation	Boundaries, buildings, driveways etc.	1.8
	Subsoil and open drains	6.0
	Swimming pools	3.0
	Treatment tanks	1.2
Subsurface Drippers	Boundaries, buildings, driveways etc.	0.5
	Subsoil and open drains	3.0
	Swimming pools	2.0
	Garden bore	10.0
On-site waste system to water resources (river, stream etc.)	-	100.0

12.3. Land Application Areas

12.3.1. State Planning Policy (SPP, 2025)

The minimum LAA size in accordance with the SPP (2025) has been calculated and is shown below. The LAA may need to be resized if the hydraulic loading changes.

Table 9: SPP LAA Calculation

Soil Category (AS1547)	Conversion Factor (Table F.2 of SPP)	Hydraulic Loading (L/day, Section 6)	Minimum LAA (m^2)
1 to 2	0.2	5,000	1,000

12.3.2. Water Balance

Water balance calculations are presented in Appendix E.

As well as the SPP minimum, the LAA must have a minimum size to meet the water balance area requirements (in accordance with the WA Health Regulations Method), calculated as 108 m^2 per 5,000 L/day of hydraulic loading.

12.3.3. Summary

The SPP sizing will govern with a minimum 1,000 m^2 total LAA per 5,000 L/day of hydraulic loading. This may need to be resized based on the actual hydraulic loading within each proposed lot.

A detailed plan will be required with the application to install that shows that the required setbacks are met, in particular to the drainage line through the HCLIA (lot configuration will need to be done to allow LAAs to achieve the required setbacks). Provided lot configurations are suitable, there 100 m setback to drainage courses should be achievable.

13. SOIL ASSESSMENT

Details of our soil assessment are presented in Attached Table 4.

14. SITE SUITABILITY AND RECOMMENDATIONS

Based on our assessment, the site is suitable for disposal of wastewater. Wastewater must have secondary treatment (i.e., an ATU).

LAA Location and Setbacks

The exact location of the LAA has not been finalised, however, we judge that setback requirements can be met. A setback of 6 m is required from the open drainage channels, wetland areas, and lakes at the site (refer Table 8). A 100 m setback will be required from the creek line

Any proposed LAA will need to satisfy the setback requirements, including meeting the appropriate distances from site boundaries, buildings, trafficable areas and driveways etc.

Disposal Method

We considered the use of leach drains to dispose of treated effluent is appropriate. Flatbed leach drains or concrete leach drains are likely to be acceptable.

Separation to Groundwater and LAA Surface Level

A minimum 1.5 m clearance to groundwater below leach drains must be achieved.

Groundwater was encountered between 0 m below ground (in low lying areas) and over 3 m below ground (in elevated areas). Surface water (judged to be an expression of the groundwater table) was observed in the table drain, wetland areas and lakes in Section 4.

Design groundwater levels for the site must be assessed by a suitably qualified civil engineer and / or hydrologist. Filling, subsoil drains and / or table drains could possibly be required to control groundwater. Levels for leach drain invert levels can be assessed once design groundwater levels are derived for the development.

We recommend that filling requirements be assessed based on proposed lot configurations and design groundwater levels as established by a hydrologist.

Treatment Units

The wastewater may be treated using an ATU (secondary treatment), also known as aerated wastewater treatment systems (AWTS). ATU's use the processes of aeration followed by clarification to achieve biological treatment of wastewater.

ATU's (or any other proposed system) must be certified to AS1546.3 (2008) and require approval by the Chief Health Officer. A list of approved ATU's is presented in Table 2 on the Department of Health website.

Soil improvement in areas of proposed fill

Any fill at the site below leach drains must have a phosphorous retention index (PRI) of at least 20, and monitored 3-yearly, in accordance with Department of Health requirements. This can be done with a product like 'gypsum', or by using high-PRI soil. High PRI soil must be present to a minimum depth of 200 mm below the base of all infiltration zones and at least 0.5 m in plan outside the leach drain footprint area.

There is no requirement for other fill above leach drains to have a minimum PRI.

15. CLOSURE

GALT GEOTECHNICS

NOTES:

1. *'BGL' – below current ground level*
2. *CPT probe hole collapsed before groundwater could be measured.*
3. *CPT probes may not have had sufficient time to recharge to hydrostatic levels.*
4. *Coffee rock layer, typically about 0.3 m to 1.0 m thick, and underlain by sand. Coffee rock inferred from CPT refusal at some locations.*
5. *Investigation typically encountered thin surficial fill / topsoil sand over clay / clayey or cemented soil layers as stated in table above. Refer Report WAG240438-01 001 R Rev2 for further details.*

Attached Table 11: Site Assessment

Consideration	Assessment / Discussion	Reference	Level of Constraint	Mitigation Measures
Geology	Refer Section 10.1. Mapped as Bassendean sand of variable thickness, with swamp deposits mapped in low lying areas (refer Inline Image 1). LAA are only to be located in areas of deep sand, at least 2 m above any clay or coffee rock layers.	Perth Sheet of the 1:50,000 Environmental Geology Series Map	Nil	-
Climate	To satisfy zero storage requirements, minimum LAA's to be sized as required for hydraulic loading.	Appendix E, Water Balance Calculation	Low	LAA to be greater than area required to meet zero storage requirement.
Exposure	Site will be cleared and broadly levelled - minimal/no tree cover or significant site aspect.	-	Low	-
Vegetation	Assumed area cleared, with minimal vegetation (i.e. limited to grass and / or shrubs)	-	Low	-
Landform and Drainage	The site generally undulates, but slopes down towards the drainage line traversing from west to east in the northern part of the site. Site drainage is controlled by this drainage line. Localised lakes are present in southern part of site, which are judged to be expressions of groundwater.	-	Moderate	Civil design to minimise rainfall run-on and run-off (using bunds/curbs etc.)
Slope	The proposed development area will be relatively flat after earthworks.	-	Low	Slope is <10% grade.
Fill (Imported)	Filling is anticipated to achieve adequate clearance to groundwater. Fill could be site derived or imported and must have similar properties as that encountered (i.e. All fill must be Soil Category 1 to 2).	-	Low	Any imported fill must have minimum hydraulic conductivity of 1.4 m/day (i.e. All fill must be Soil Category 1 to 2).
PDWSAs	The site is **not** mapped as being within a public drinking water source area.	Department of water (DoW) mapping service	-	-
SSAs	The site is mapped as a Sewage Sensitive Area, being within 1 km of a significant wetland and within the catchment of the Swan Coastal Plan.	Department of lands and heritage (DPLH) mapping service.	Moderate	The underside of any disposal area must be at least 1.5 m above the design groundwater level, provided a secondary treatment system is used.

Attached Table 11: Site Assessment CONTINUED (Page 2 of 2)

Consideration	Assessment / Discussion	Reference	Level of Constraint	Mitigation Measures
Surface gravel and rock outcrops	We did not note any significant surficial gravel and rock outcrops.	Section 11	Low	-
Groundwater Level	Groundwater currently between 0 m below ground (in low lying areas) and over 3 m below ground (in elevated areas). Surface water (judged to be an expression of the groundwater table) was observed in the table drain, wetland areas and lakes discussed above and in Section 4. Design groundwater levels for the site must be assessed by a suitably qualified civil engineer and / or hydrologist. Filling, subsoil drains and / or table drains could possibly be required.	Table 7	Moderate	The underside of any disposal area must be at least 1.5 m above the design groundwater level, provided a secondary treatment system is used.
Groundwater Separation	A minimum groundwater separation of 0.6 m is required for treated effluent at the site.	Government Sewerage Policy (2019)	Moderate	Refer comment above.
Rainfall Run-on/Seepage	Site slopes and levels will be changed significantly by bulk earthworks. Some rainfall run-on and run-off may occur.	-	Moderate	Incident rainfall must be diverted away from LAA's using curbs or diversion bunds. Similarly, any run-off must be prevented by either having a level LAA, or by using retention bunds.
Surface Water/Water Resources	As discussed in Section 4, Surface water (judged to be an expression of the groundwater table) was observed in - the table drain traversing west to east through the northern part of the site - the wetland area in the western part of the site near Lewis Road; and - lakes in the southern part of the site. It is possible some of these features will be removed as part of earthworks.	-	Moderate	LAA to be positioned so the required minimum setbacks to water resources are met. Particularly a 6 m offset from open drainage channels (refer Table 8) and 100 m offset from the creek in the HCLIA.
Flood Potential	The site is **not** mapped as a Floodplain Development Control Area	DWER floodplain mapping	-	-
Setbacks	All setbacks to be met.	Section 12.2	High	LAA to meet setback requirements.
LAA	The minimum total LAA area by the SPP 2025 method is 1,000 m^2 per 5,000 L/day of hydraulic loading. This will need to be resized as required for the actual hydraulic loading within each proposed lot.	Section 12.3.3	Low	LAA to be sized to meet the minimum required infiltrative area and setbacks.

Attached Table 12: Soil Assessment

Consideration	Assessment / Discussion				Reference	Level of Constraint	Mitigation Measures
Subsurface Soil Conditions	In proposed LAA areas, soil conditions to comprise SAND with a minimum permeability of 1.4 m/day (i.e. Soil Category 1 or 2). To a depth of no less than 2 m. This is achievable for most of the site.				Section 11	Moderate	-
Acid Sulfate Soils	Organic soils near drainage lines, wetland areas and possibly within existing lakes could have a high acid sulfate soil risk. LAA's are to be located away from these features in sand above the groundwater, and therefore no significant ASS risk is present.				Department of Environmental Regulation (DER) mapping	Low	-
Soil Category	In situ soil in proposed LAA areas is Category 1 to 2				AS1547-2012	Moderate	Any imported fill must have minimum hydraulic conductivity of 1.4 m/day to meet these assumptions (i.e. All fill must be Soil Category 1 to 2). LAA areas not to be near drainage lines or wetland areas where surficial organic clayey soils could be present.
Design Loading Rates	50 mm/day				Table L1, AS1547-2012	-	Secondary treated effluent
Laboratory Testing in SAND	**Level of Constraint**						-
	Result	**Low**	**Medium**	**High**			
Coarse Fragments[1]	Up to 6%	<10%	10-40%	>40%	-	Low	Erosion risk is relatively low and can be controlled around perimeter using geotextile / vegetation / etc.. as per civil design requirements. No reduction in permeability necessary to account for gravel.
Phosphorous Retention Index (PRI)[2]	-0.5 to 4.0	>20	5-20	<5		High	The upper 0.2 m of soil below leach drains must comprise high PRI (PRI>20) soil to ensure nutrient stripping capability.
pH[1]	5.8 to 7.8	6-8	4.5-6	<4.5,>8		Low to Medium	In situ soil not considered to be significantly erodible.
Exchangeable Sodium Percentage[1]	Not Reportable	<10	10-20	<20		-	
Electric Conductivity (dS/m)[1]	0.014 to 0.110	<0.3	0.3 – 2.0	>2.0		Low	
Emerson Class[1]	NIL	> 4	4	1 - 3		-	-

Notes: 1) *Level of constraint based on our interpretation of AS1547 description of "non-dispersive soils".* ***2)*** *Phosphorus retention index requirements are based on our interpretation of The Department of Primary Industries and Regional Development Standards for Land Resource Mapping (2005), as this is not specified in AS1547.*

DEFINITIONS

q_t : Cone tip resistance corrected for pore water pressure
S_t : Sensitivity
e : Void ratio
D_r : Relative density
OCR : Overconsolidation ratio
OC : Overconsolidated

SOIL BEHAVIOUR TYPE ZONES

1. Sensitive fine grained
2. Organic material
3. Clay
4. Silty clay to clay
5. Clayey silt to silty clay
6. Sandy silt to clayey silt
7. Silty sand to sandy silt
8. Sand to silty sand
9. Sand
10. Gravelly sand to sand
11. Very stiff fine grained material (OC/cemented)
12. Sand to clayey sand (OC/cemented)

NOTES

A. Some overlap in type zones is expected
B. Local correlations are preferred and may indicate soil type boundaries that are different from those shown above

Appendix C: Machine Borehole Logs

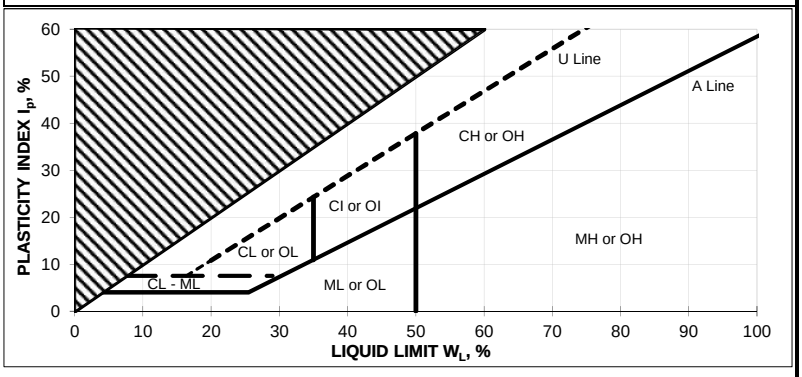
METHOD OF SOIL DESCRIPTION
BOREHOLE AND TEST PIT REPORTS

GRAPHIC LOG & SOIL CLASSIFICATION SYMBOLS

Graphic	USCS	Soil Name
		FILL (various types)
		COBBLES / BOULDERS
	GP	GRAVEL (poorly graded)
	GW	GRAVEL (well graded)
	GC	Clayey GRAVEL
	GM	Silty GRAVEL
	SP	SAND (poorly graded)
	SW	SAND (well graded)
	SC	Clayey SAND

Graphic	USCS	Soil Name
	SM	Silty SAND
	ML	SILT (low liquid limit)
	MH	SILT (high liquid limit)
	CL	CLAY (low plasticity)
	CI	CLAY (medium plasticity)
	CH	CLAY (high plasticity)
	OL	Organic SILT (low liquid limit)
	OH	Organic SILT (high liquid limit)
	Pt	PEAT

NOTE: Dual classification given for soils with a fines content between 5% and 12%.



SOIL CLASSIFICATION AND INFERRED STRATIGRAPHY

Soil descriptions are based on AS1726-2017. Material properties are assessed in the field by visual/tactile methods in combination with field and laboratory testing techniques (where used).

NOTE: AS 1726-2017 defines a fine grained soil where the total dry mass of fine fractions (<0.075 mm particle size) exceeds 35%.

PARTICLE SIZE		
Soil Name		**Particle Size (mm)**
BOULDERS		>200
COBBLES		63 to 200
GRAVEL	Coarse	19 to 63
	Medium	6.7 to 19
	Fine	2.3 to 6.7
SAND	Coarse	0.6 to 2.36
	Medium	0.21 to 0.6
	Fine	0.075 to 0.21
FINES	SILT	0.002 to 0.075
	CLAY	<0.002

PLASTICITY - MODIFIED CASAGRANDE CHART - AS1726-2017

RESISTANCE TO EXCAVATION		
Symbol	**Term**	**Description**
VE	Very easy	All resistances are relative to the selected method of excavation
E	Easy	
F	Firm	
H	Hard	
VH	Very hard	

MOISTURE CONDITION	
Symbol	**Term**
D	Dry
M	Moist
W	Wet

CEMENTATION	
Cementation	**Description**
Weakly cemented	Soil may be easily disaggregated by hand in air or water
Moderately cemented	Effort is required to disaggregate the soil by hand in air or water

CONSISTENCY		
Symbol	**Term**	**Undrained Shear Strength (kPa)**
VS	Very Soft	0 to 12
S	Soft	12 to 25
F	Firm	25 to 50
St	Stiff	50 to 100
VSt	Very Stiff	100 to 200
H	Hard	>200

ORGANIC SOILS	
Material	**Organic Content % of dry mass**
Inorganic soil	<2%
Organic soil	2% to 25%
Peat	>25%

DENSITY		
Symbol	**Term**	**Density Index (%)**
VL	Very Loose	<15
L	Loose	15 to 35
MD	Medium Dense	35 to 65
D	Dense	65 to 85
VD	Very Dense	>85

EXPLANATORY NOTES TO BE READ WITH BOREHOLE AND TEST PIT REPORTS

METHOD OF DRILLING OR EXCAVATION

AC	Air Core	E	Excavator	PQ3	PQ3 Core Barrel
AD/T	Auger Drilling with TC-Bit	EH	Excavator with Hammer	PT	Push Tube
AD/V	Auger Drilling with V-Bit	HA	Hand Auger	R	Ripper
AT	Air Track	HE	Hand Excavation	RR	Rock Roller
B	Bulldozer Blade	HQ3	HQ3 Core Barrel	SON	Sonic Rig
BH	Backhoe Bucket	N	Natural Exposure	SPT	Driven SPT
CT	Cable Tool	NMLC	NMLC Core Barrel	WB	Washbore
DT	Diatube	PP	Push Probe	X	Existing Excavation

SUPPORT

T	Timbering

PENETRATION EFFORT (RELATIVE TO THE EQUIPMENT USED)

VE	Very Easy	E	Easy	F	Firm
H	Hard	VH	Very Hard		

WATER

►	Water Inflow	▼	Water Level
◄	Water Loss (complete)		
◁	Water Loss (partial)		

SAMPLING AND TESTING

B	Bulk Disturbed Sample	P	Piston Sample
BLK	Block Sample	PBT	Plate Bearing Test
C	Core Sample	U	Undisturbed Push-in Sample
CBR	CBR Mould Sample		U50: 50 mm diameter
D	Small Disturbed Sample	SPT	Standard Penetration Test
ES	Environmental Soil Sample		Example: 3, 4, 5 N=9
EW	Environmental Water Sample		3,4,5: Blows per 150 mm
G	Gas Sample		N=9: Blows per 300 mm after
HP	Hand Penetrometer		150 mm seating interval
LB	Large Bulk Disturbed Sample	VS	Vane Shear; P = Peak
M	Mazier Type Sample		R = Remoulded (kPa)
MC	Moisture Content Sample	W	Water Sample

ROCK CORE RECOVERY

TCR = Total Core Recovery (%) $= \frac{CRL}{TCL} \times 100$

RQD = Rock Quality Designation (%) $= \frac{ALC>100}{TCL} \times 100$

TCL	Length of Core Run
CRL	Length of Core Recovered
ALC>100	Total Length of Axial Lengths of Core Greater than 100 mm Long

Water Balance for Zero Storage

Site Address:	**Hatch Court and Stirling Crescent, High Wycombe WA**		
Date:	Wednesday, 24 September 2025	**Assessor:**	Tyrone Mardesic

INPUT DATA

Design Wastewater Flow	Q	5,000	L/day	Based on maximum potential occupancy and derived from the Supplement to Regulation 29 and Schedule 9 - Wastewater system loading rates
Design Irrigation Rate	DIR	50.0	mm/day	Based on soil texture class/permeability and derived from Table M1 of AS/NZS 1547:2012
Nominated Land Application Area	L	108	m^2	[1]
Crop Factor	C	0.8-1.0	unitless	Estimates evapotranspiration as a fraction of pan evaporation; varies with season and crop type[2]
Rainfall Runoff Factor	RF	1.0	untiless	Proportion of rainfall that remains onsite and infiltrates, allowing for any runoff
Mean Monthly Rainfall Data		Midland		BoM Station and number
Mean Monthly Pan Evaporation Data		Upper Swan		BoM Station and number or data from the Evaporation Data for Western Australia Report (https://researchlibrary.agric.wa.gov.au/cgi/viewcontent.cgi?article=1058&context=rmtr

Phosphorus Retention Index	-		21	200	4.0	0.50	1.5

Method Summary

Method ID	Methodology Summary
AGRI-003_PRI	Phosphorous Retention index (PRI) is the ratio of adsorbed phosphorus to the equilibrium concentration. Phosphorus is extracted using KCl and determined colourimetrically. Result value is used to calculate PRI as per Allen and Jefferey.
INORG-001	pH - Measured using pH meter and electrode. Please note that the results for water analyses are indicative only, as analysis can be completed outside of the recommended holding times. Solids are reported from a 1:5 water extract unless otherwise specified. Alternatively, pH is determined in a 1:5 extract using 0.01M calcium chloride or a solid is extracted at a ratio of 1:2.5 (AS1289.4.3.1), pH is measured in the extract.
INORG-002	Conductivity and Salinity - measured using a conductivity cell at 25°C. Soil results reported from a 1:5 Soil:Water extract unless otherwise specified. Please note Resistivity is estimated by calculation and may not correlate with results otherwise obtained using the Resistivity current method (based on AS 1289.4.4.1), depending on the nature of the soil being analysed. Blanks may yield EC readings >1µS/cm, this is likely due to adsorption of Carbon Dioxide while the blank sample is sat on the instrument autosampler prior to analysis. The values are generally insignificant (<5µS/cm) compared to most actual sample conductivities.

Result Definitions

Identifier	Description
NR	Not reported
NEPM	National Environment Protection Measure
NS	Not specified
LCS	Laboratory Control Sample
RPD	Relative Percent Difference
>	Greater than
<	Less than
PQL	Practical Quantitation Limit
INS	Insufficient sample for this test
NA	Test not required
NT	Not tested
DOL	Samples rejected due to particulate overload (air filters only)
RFD	Samples rejected due to filter damage (air filters only)
RUD	Samples rejected due to uneven deposition (air filters only)
##	Indicates a laboratory acceptance criteria outlier, for further details, see Result Comments and/or QC Comments

Quality Control Definitions

Blank

This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, and is determined by processing solvents and reagents in exactly the same manner as for samples.

Surrogate Spike

Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

LCS (Laboratory Control Sample)

This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.

Matrix Spike

A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.

Duplicate

This is the complete duplicate analysis of a sample from the process batch. The sample selected should be one where the analyte concentration is easily measurable.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria. Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction. Spikes for Physical and Aggregate Tests are not applicable. For VOCs in water samples, three vials are required for duplicate or spike analysis.

General Acceptance Criteria (GAC) - Analyte specific criteria applies for some analytes and is reflected in QC recovery tables.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% - see ELN-P05 QAQC tables for details (available on request); <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase. Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was typically insufficient in order to satisfy laboratory QA/QC protocols.

Miscellaneous Information

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached. We have taken the sampling date as being the date received at the laboratory.

Two significant figures are reported for the majority of tests and with a high degree of confidence, for results <10*PQL, the second significant figure may be in doubt i.e. has a relatively high degree of uncertainty and is provided for information only.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, Total Recoverable metals and PFAS where sediment/solids are included by default.

Urine Analysis - The BEI values listed are taken from the 2022 edition of *TLVs and BEIs Threshold Limits by ACGIH*.

Air volumes are typically provided by customers (often as flow rate(s) and sampling time(s) and/or simply volume(s) sampled or exposure times (determines 'volume' passive badges are exposed to)). Hence in such circumstances the volume measurement is inevitably not covered by Envirolab's NATA accreditation. An exception may occur where Envirolab Newcastle does the sampling where accreditation exists for certain types of sampling and hence volume determination(s). Note air volumes are often used to determine concentrations for dust and/or analyses on filters, sorbents and in impingers. For canister sampling, the air volume is covered by Envirolab's NATA accreditation.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from the latest "Australian Drinking Water Guidelines", published by NHMRC. No guideline values have been set for Total Coliforms in drinking water. Increased concentrations should be investigated. Total Coliforms are not considered useful as indicators of the presence of faecal contamination.

Where we have provided guideline values eg. ADWG Health Value, it is the responsiblity of the reader to decide if the water is fit for consumption. Please note that the tests we have conducted are just a selection of common tests to give you a general idea of drinking water quality. There are many other tests included in the ADWG that we have not tested for.

Data Quality Assessment Summary PGI0989

Client Details

Client	Western Geotechnical & Laboratory Services
Your Reference	S18630 / Proposed HCLIA
Date Issued	19/09/2025

Recommended Holding Time Compliance

No recommended holding time exceedances

Quality Control and QC Frequency

QC Type	Compliant	Details
Blank	Yes	No Outliers
LCS	Yes	No Outliers
Duplicates	Yes	No Outliers
Matrix Spike	Yes	No Outliers
Surrogates / Extracted Internal Standards	Yes	No Outliers
QC Frequency	Yes	No Outliers

Surrogates/Extracted Internal Standards, Duplicates and/or Matrix Spikes are not always relevant/applicable to certain analyses and matrices. Therefore, said QC measures are deemed compliant in these situations by default. See Laboratory Acceptance Criteria for more information

Understanding your Report

1. EXPECTATIONS OF THE REPORT

The following sections have been prepared to clarify what is and is not provided in your report. It is intended to inform you of what your realistic expectations of this report should be and how to manage your risks associated with the conditions on site.

Geotechnical engineering and environmental science are less exact than other engineering and scientific disciplines. We include this information to help you understand where our responsibilities begin and end. You should read and understand this information. Please contact us if you do not understand the report or this explanation. We have extensive experience in a wide variety of projects and we can help you to manage your risk.

2. THIS REPORT RELATES TO PROJECT-SPECIFIC CONDITIONS

This report was developed for a unique set of project-specific conditions to meet the needs of the nominated client. It took into account the following:

- the project objectives as we understood them and as described in this report;
- the specific site mentioned in this report; and
- the current and proposed development at the site.

It should not be used for any purpose other than that indicated in the report. You should not rely on this report if any of the following conditions apply:

- the report was not written for you;
- the report was not written for the site specific to your development;
- the report was not written for your project (including a development at the correct site but other than that listed in the report); or
- the report was written before significant changes occurred at the site (such as a development or a change in ground conditions).

You should always inform us of changes in the proposed project (including minor changes) and request an assessment of their impact.

Where we are not informed of developments relevant to your report, we cannot be held responsible or liable for problems that may arise as a consequence.

Where design is to be carried out by others using information provided by us, we recommend that we be involved in the design process by being engaged for consultation with other members of the project team. Furthermore, we recommend that we be able to review work produced by other members of the project team that relies on information provided in our report.

3. DATA PROVIDED BY THIRD PARTIES

Where data is provided by third parties, it will be identified as such in our reports. We necessarily rely on the completeness and accuracy of data provided by third parties in order to draw conclusions presented in our reports. We are not responsible for omissions, incomplete or inaccurate data associated with third party data, including where we have been requested to provide advice in relation to field investigation data provided by third parties.

4. SOIL LOGS

Our reports often include logs of intrusive and non-intrusive investigation techniques prepared by Galt. These logs are based on our interpretation of field data and laboratory results. The logs should only be read in conjunction with the report they were issued with and should not be re-drawn for inclusion in other documents not prepared by us.

5. THIRD PARTY RELIANCE

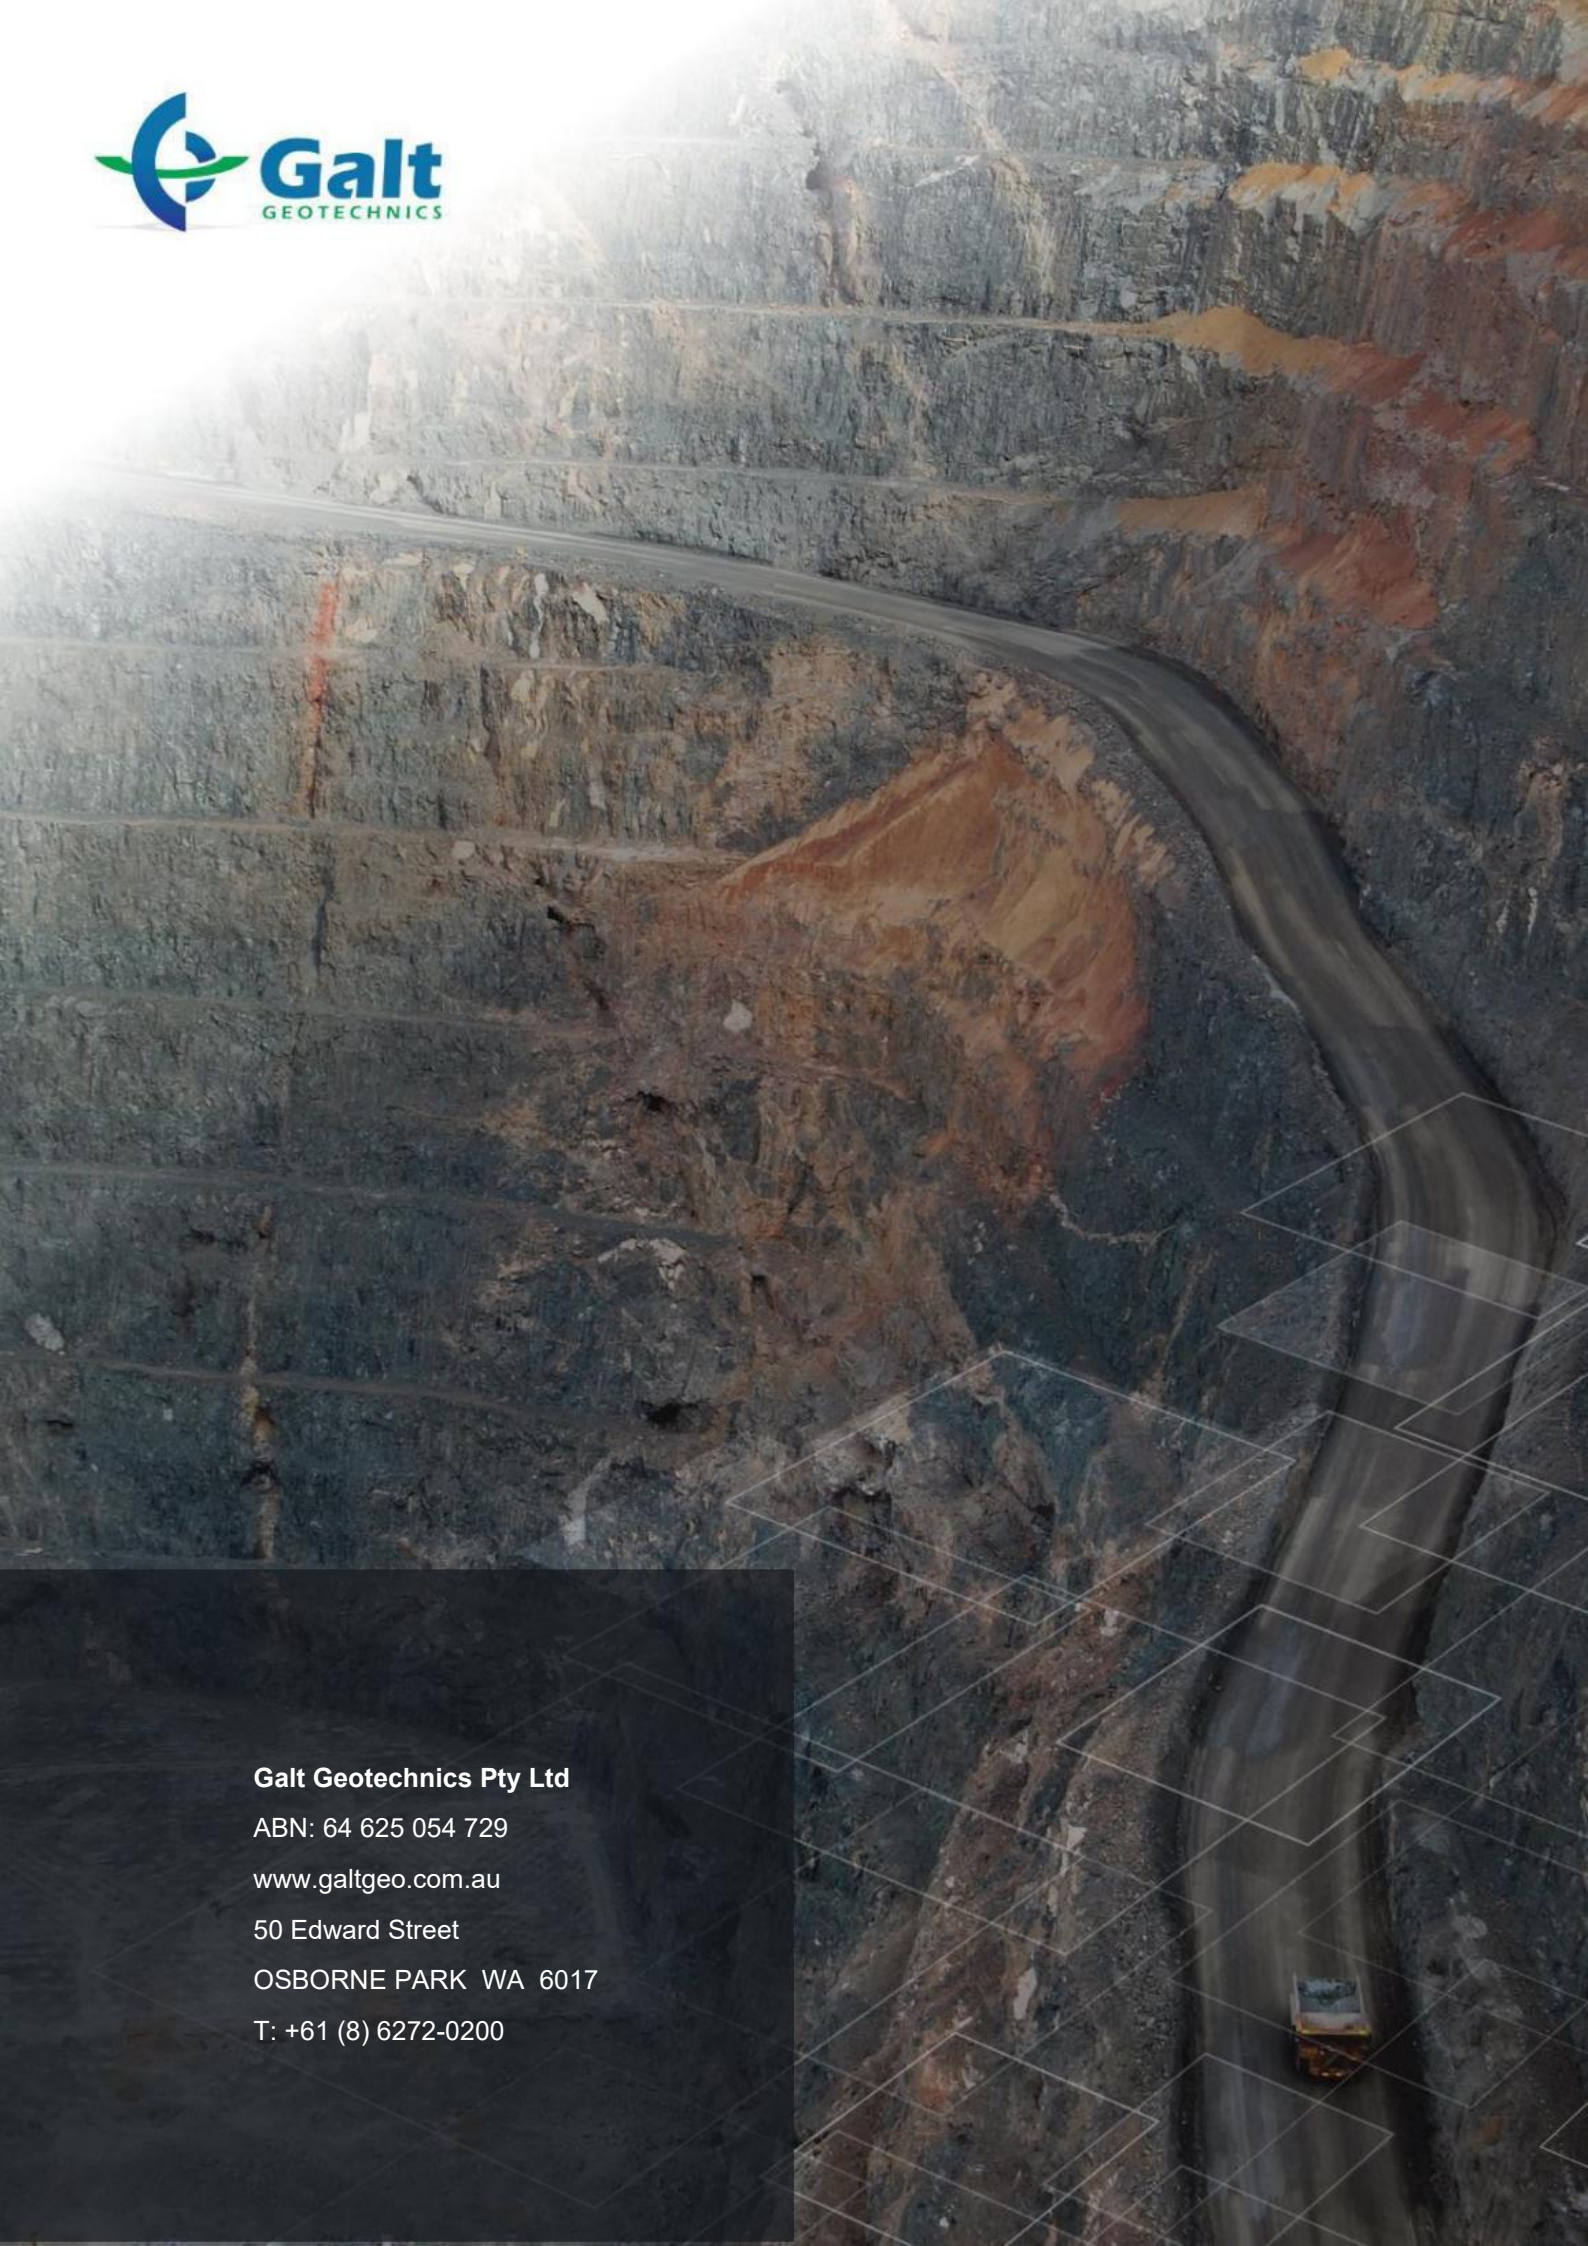
We have prepared this report for use by the client. This report must be regarded as confidential to the client and the client's professional advisors. We do not accept any responsibility for contents of this document from any party other than the nominated client. We take no responsibility for any damages suffered by a third party because of any decisions or actions they may make based on this report. Any reliance or decisions made by a third party based on this report are the responsibility of the third party and not of us.

6. CHANGE IN SUBSURFACE CONDITIONS

The recommendations in this report are based on the ground conditions that existed at the time when the study was undertaken. Changes in ground conditions can occur in numerous ways including anthropogenic events (such as construction or contaminating activities on or adjacent to the site) or natural events (such as floods, groundwater fluctuations or earthquakes). We should be consulted prior to use of this report so that we can comment on its reliability. It is important to note that where ground conditions have changed, additional sampling, testing or analysis may be required to fully assess the changed conditions.

7. SUBSURFACE CONDITIONS DURING CONSTRUCTION

Practical constraints mean that we cannot know every minute detail about the subsurface conditions at a particular site. We use professional judgement to form an opinion about the subsurface conditions at the site. Some variation to our evaluated conditions is likely and significant variation is possible. Accordingly, our report should not be considered as final as it is developed from professional judgement and opinion.



The most effective means of dealing with unanticipated ground conditions is to engage us for construction support. We can only finalise our recommendations by observing actual subsurface conditions encountered during construction. We cannot accept liability for a report's recommendations if we cannot observe construction.

8. ENVIRONMENTAL AND GEOTECHNICAL ISSUES

Unless specifically mentioned otherwise in our report, environmental considerations are not addressed in geotechnical reports. Similarly, geotechnical issues are not addressed in environmental reports. The investigation techniques used for geotechnical investigations can differ from those used for environmental investigations. It is the client's responsibility to satisfy themselves that geotechnical and environmental considerations have been taken into account for the site.

Geotechnical advice presented in a Galt Environmental report has been provided by Galt Geotechnics under a sub-contract agreement. Similarly, environmental advice presented in a Galt Geotechnics report has been provided by Galt Environmental under a sub-contract agreement.

Unless specifically noted otherwise, no parties shall draw any inferences about the applicability of the Western Australian state government landfill levy from the contents of this document.

RELIANCE, USES and LIMITATIONS

This report is copyright and is to be used only for its intended purpose by the intended recipient and is not to be copied or used in any other way. The report may be relied upon for its intended purpose within the limits of the following disclaimer.

This study, report and analyses have been based on the information available to Peritas Group at the time of preparation. Peritas Group accepts responsibility for the report and its conclusions to the extent that the information was sufficient and accurate at the time of preparation. Peritas Group does not take responsibility for errors and omissions due to incorrect information or information not available to Peritas Group at the time of preparation of the study, report or analyses.

EXECUTIVE SUMMARY

Key constraints and recommendations of this report are summarised as follows:

Risk Matrix

Consequence Likelihood	Insignificant	Minor	Moderate	Major	Severe
Remote	Insignificant	Insignificant	Low	Low	Medium
Unlikely	Insignificant	Low	Low	Medium	Medium
Possible	Low	Low	Medium	Medium	High
Likely	Low	Medium	Medium	High	High
Almost Certain	Medium	Medium	High	High	Extreme

Qualitative Measures of Likelihood or Frequency

Scale	Criteria to be used to establish rating
Almost Certain	Will occur. Circumstances or situations are likely to arise often throughout the planning / project period which provide the opportunity for crystallization of risk. Expect frequent, regular occurrences.
Likely	Likely to occur more than once in the planning period but not an 'everyday' occurrence. Preconditions will arise at times throughout the period.
Possible	Likely to occur at least once but not expected to occur much more than this in the planning period.
Unlikely	Not likely to occur in the planning period. A small, but remote chance of occurrence due to circumstances/situations that could arise.
Remote	Would only occur in highly exceptional circumstances that are unlikely to exist in any planning period. Extremely remote chance of occurrence in planning period. 'Once in a lifetime' event.

Qualitative Measures of Impact – Consequence Severity

Impact	Consequence Criteria
Severe	Near impossible to develop subject site and expected development viability is very low. E.g., Significant Habitat, Major floodway within site etc. Requires comprehensive development viability analysis and specialist input.
Major	Very difficult to develop subject site and expected development viability is low, will involve significant investigations, very expensive major service relocations, many significant trees of excellent health etc. Requires development viability analysis and specialist input as required.
Moderate	Challenging to develop subject site, expected development viability is adequate, will involve further investigations, costly service relocations, many registered trees of excellent health etc. Specialist input as required.

Minor	Relatively simple challenges to develop site, expected development viability is good. Minor upgrades to existing services are required to develop site.
Insignificant	No challenges or risk to program in developing site.

Degree of Risk

Risk Rating	Definition of Risk Rating
Insignificant	Certain development prospect, no foreseeable challenges.
Low	Site is developable with only minor works or investigations required. It is advised to progress to continue the development process.
Medium	Site is developable with significant works or investigations required. It is advised to progress to continue the development process.
High	Site is developable with major works or investigations required. No further investigation recommended without cost benefit analysis first being undertaken.
Extreme	Site or component is undevelopable or unviable without significant changes.

Key Site Risks

Below summarises key site risks with associated risk ratings and high-level recommendations to improve clarity for planning and approvals:

VEHICULAR ACCESS

Risk Description: The subject site currently obtains vehicular access from Stirling Crescent, Adelaide Street and Kalamunda Road. Construction of the internal shared road network for the development, together with the site's reliance on the surrounding road network, will require coordination with any broader regional road upgrades planned by MRWA. In particular, future upgrades affecting Stirling Crescent, Kalamunda Road and adjoining intersections may influence the ultimate access arrangements, intersection treatments, staging of works and timing of development within the Hatch Court Light Industrial Area. While the planned regional road improvements are expected to enhance industrial access, efficiency and safety across the HCLIA (as outlined in Section 5.1), the timing and staging of these upgrades relative to the proposed development's subdivision and construction programme represents a key consideration.

Risk: MEDIUM

Recommendation: Ongoing consultation should be undertaken with the City of Kalamunda, MRWA and the project traffic engineers to monitor the status and timing of regional road upgrade projects and confirm their implications for the HCLIA. Detailed traffic impact assessments should be updated as the proposal progresses to ensure that the internal road network and access arrangements remain compatible with the ultimate regional road configuration. Where necessary, road infrastructure upgrades and associated contributions should be identified early and incorporated into the development staging strategy to minimise approval risks and facilitate the orderly delivery of the subdivision.

Refer to **Section 5.1** for further information.

BUSHFIRE

Risk Description: The current online bushfire mapping listed on the Department of Fire & Emergency Services (DFES) website demonstrates that the subject site is within a Bushfire Prone Area. Additional planning and building requirements will likely apply to the proposed development.

Risk: MEDIUM

Recommendation: Additional planning and building requirements may apply to the proposed subdivisional development in accordance with Schedule 2 Part 10A of the Planning and Development (Local Planning Schemes) Regulations 2015, State Planning Policy 3.7, WA Guidelines for planning in Bushfire Prone Areas, and the Building Code of Australia.

Refer to **Section 2.6** for further information.

SITE GRADING AND EARTHWORKS

Risk Description: Site grading within the Hatch Court Light Industrial Area (HCLIA) will generally be determined by the proposed building pads, servicing requirements and environmental and geotechnical constraints of the site to ensure a sustainable as well as economic development. Bulk Earthworks will be dictated by building pads and vehicle access point. The stormwater strategy will need to be confirmed; however, it is likely that stormwater for major storm events will be directed naturally towards the closest watercourse. The available geotechnical investigation provides sufficient information to inform the preliminary stormwater management strategy for the Hatch Court Light Industrial Area (HCLIA), including site-specific groundwater conditions, soil profiles and infiltration characteristics. During the detailed design phase, the developer may be required to commission additional targeted geotechnical and infiltration investigations, where necessary, to confirm the design and sizing of stormwater infrastructure in areas affected by shallow groundwater, coffee rock or organic soils. Any additional investigations may incur further costs and could impact on the detailed design and delivery programme for the proposed development.

Risk: MEDIUM

Recommendation: The earthworks within the Hatch Court Light Industrial Area (HCLIA) will primarily be determined by the proposed drainage requirements, building pad levels and the servicing requirements associated with the wider Structure Plan (SCP), including the proposed road network and utility infrastructure. Earthworks will be designed to achieve suitable grades for lot development while accommodating the proposed stormwater, sewer, water and other civil infrastructure.

The general topography of the subject sites is mild sloping from east to west at approximately 1 in 50 to 1 in 100 slopes across the site. The highest point is at the intersection of Hatch Court and Stirling Crescent at approximately 24m AHD and the lowest point is over the subject site at approximately 20m AHD at the western boundary of the site. A geotechnical investigation has been undertaken for the site, which identified shallow groundwater across parts of the site and recommends raising above groundwater levels using imported and compacted sand fill, together with dewatering during construction in lower-lying areas. Shallow groundwater may potentially have an adverse effect on stormwater infrastructure or the proposed development if not appropriately managed. Further site-specific geotechnical investigation is recommended as part of future DA/building permit applications, to confirm final pad levels, groundwater conditions, and site preparation requirements for individual lots.

Refer to **Section 3** for further information.

SEWER

Risk Description: Development to date within the Hatch Court Light Industrial Area has proceeded with onsite effluent disposal, as the site is not currently connected to a reticulated sewer network, with the nearest existing sewer infrastructure within the planned catchment for the landholdings, located a significant distance from the subject land. Each development site will be required to assess its needs with regards to wastewater disposal and make due applications to the regulatory health authorities for on-site treatment and disposal.

Advice from the Water Corporation is that the Structure Plan Area is dependent on the sewers to the north heading across the bypass, where the current sewer catchment planning shows sewerage from the area is required to discharge. There are existing sewers located to the south west at the intersection of Striling Crescent and Acton Link and Wem Mews and to the north east at the intersection of Benson Way /Stirling Crescent, however, connection to these existing sewers can only be achieved provided a suitable depth to the sewer is established as part of the extension works.

Risk: **HIGH**

Recommendation: Confirm proposed layout of the residential development and assess the impact on the existing sewer. Provide Water Corporation with additional information detailing the residential subdivision levels to confirm whether Water Corporation will entertain connecting either all or a portion of the proposed residential area within the LSP area. Current advice is that the area will require servicing to the north/northwest through landholdings outside of the LSP area.

Water Corporation will also be required to confirm serviceability of the site based on the ultimate design of the development.

Refer to **Section 6** for further information.

POTABLE WATER

Risk Description: The subject site is currently serviced by existing potable water mains located along Stirling Crescent and the Hatch Court cul-de-sac, which primarily provide residential connections. These existing assets offer potential connection points for the proposed water reticulation network; however, the suitability of these connections will depend on the ultimate water demand generated by the development.

A detailed assessment of potable water requirements will be necessary to determine whether upgrades or additional water reticulation infrastructure will be required to adequately service the development. This assessment should consider peak demand, fire flow requirements, staging, and the capacity of surrounding network assets.

All internal potable water reticulation infrastructure is to be designed and constructed in accordance with the relevant Australian Standards and the Water Corporation of Western Australia's design, construction, and servicing requirements to ensure compliance, service reliability, and long-term operational performance.

Risk: **MEDIUM**

Recommendation: Confirm the existing potable water infrastructure's connection, alignment, and size. Correspondence with Water Corporation has confirmed that the current existing water infrastructure will require upgrades. All internal potable water reticulation pipework is to be designed and constructed to the standards and requirements of the Water Corporation of Western Australia. Standard Water Corporation water headwork charges will apply. Verification with the Water Corporation will also be required to confirm serviceability of the site based on the ultimate design of the development. Refer to **Section 6** for further information.

STORMWATER DRAINAGE

Risk Description: An existing double-side entry stormwater pit is located on HCLIA with a 300mm pipe connection through to the existing drainage easement on the subject site. The majority of the stormwater on Hatch court flows to the side entry pit, however stormwater from the cul-de-sac head flows back onto adjoining private property. Construction of on-site stormwater drainage infrastructure will be required for the proposed development which may incur additional costs and potential delays in timeframe. There are also potential risks involved with clashes between the drainage corridors and other services that will traverse the local road network, as well as safety issues surrounding the drainage corridor depths.

Risk: : MEDIUM

Recommendation: Drainage should be constructed in accordance with the Hatch Court Local Water Management Strategy (LWMS) and subsequent Urban Water Management Plans. MRWA safety guidelines should be adhered to for depth and swale slope steepness, the slope must not be greater 1 in 4 and the height must not exceed 0.9m.

Refer to **Section 6** for further information.

SUBSOIL DRAINAGE

Risk Description: The subject site will require subsoil drainage after development due to the close proximity of the finished ground levels to the groundwater table.

Risk: MEDIUM

Recommendation: Subsoil drains are to be installed within the verge to manage groundwater levels, as recommended by the hydrological consultant. The subsoil drainage pipes should be designed to convey groundwater to the nearby waterway.

Refer to **Section 6** for further information.

GAS

Risk Description: DBYD information and review of the Atco gas network coverage map shows that there is reticulated gas services available in the immediate surrounding area. A 63 PE 1.5 PEHP 70kPa polyethylene high pressure gas main runs along Hatch Court. A Critical Asset Warning applies to this area. No works within 15 metres of the critical assets are permitted without prior written approval from ATCO Gas Australia. Hand exposure via pothole method is mandatory prior to any excavation in the vicinity of these assets. The project team must contact ATCO Gas Australia directly before commencing any works.

Risk: MEDIUM

Recommendation: Confirm the existing gas service infrastructure's connection, alignment and size.

Refer to **Section 6** for further information.

PEDESTRIAN ACCESS

Risk Description: There is currently no existing Pedestrian Path located in the general vicinity of the subject site. The provision of pedestrian infrastructure upgrades or modifications if required may incur additional costs for the development, however, is likely to be shared over the total development.

Risk: LOW

Recommendation: Peritas recommend undertaking a condition report of the existing bus stops surrounding the site prior to award of the contract to the builder. Any damage during the construction to be rectified by the builder.

ENVIRONMENTAL CONTAMINATION

Risk Description: A contaminated land search on the DWER website indicates the site is not within known contaminated sites. No further actions from an environmental contamination perspective are required for the proposed development site. There is high to moderate risk and moderate to low risk (<3m from the surface) Acid Sulfate Soils (ASS) in the subject site as per the geotechnical investigations.

Risk: LOW

Recommendation: Further actions from an environmental contamination perspective may be required for the proposed development within both the Hatch Court Light Industrial Area (HCLIA) and the wider Structure Plan (SCP) area, where applicable. Future development proposals, including the extent and depth of excavation, dewatering requirements for sewer and other underground service installations, and the location of works, will determine whether further contamination investigations and acid sulfate soil (ASS) management are required within each area. Refer to Sections 2.4 and 2.7 for further information.

Refer to **Section 2.4 and 2.7** for further information.

ELECTRICAL AND STREETLIGHTING

Risk Description: The proposed development currently has overhead HV and LV infrastructure in the subject site vicinity. Existing overhead High Voltage distribution lines (1 kV – 33 kV) and a Transmission line (33 kV – 330 kV) are present within and adjacent to the precinct, along with Low Voltage overhead lines (< 1 kV) serving existing lots. Underground HV/LV cables, street light circuits, pillars and terminations are also present within the local road network including along Stirling Crescent. All works in proximity to these assets must comply with Western Power clearance requirements.

Risk: MEDIUM

Recommendation: Confirm the existing electrical service infrastructure's connection, alignment, and size. An EPR/LFI assessment is required when a transformer/switchgear is installed as part of the subdivision. An application to the Western Power Transmission team is required for an assessment to determine the easement width. Western power assessment is required before carrying out any work in the vicinity

Refer to Section 6.5 for further information.

FLOOD.

Risk Description: DWER confirms they have no information on flooding or flood levels at this location.

Risk: Low

Recommendation: A minimum habitable floor level of 0.5 metre above the adjacent 1% AEP flood level is recommended to ensure adequate flood protection.

Refer to **Section 2.8** for further information.

APPENDIX D – GROUNDWATER MAPPING .....

1. INTRODUCTION

Peritas Group was commissioned by Dynamic Planning and Developments on behalf of the City of Kalamunda to review the engineering constraints and servicing requirements associated with the Development of the subject site.

The subject site comprises of a light industry area and several residential lots to a total of approximately 33.6 hectares as shown in **Figure 1** below. The subject site is located approximately 14kms northeast of the Perth CBD and 6km from the Perth International airport. The High Wycombe Train station is located approximately 4km from the subject site. The site is located in close proximity to major road links, including Roe Highway, Kalamunda Road and Abernethy Road.

Figure 1 Aerial View

The majority of the site is clear of significant vegetation with minimum existing structures, which will need to be considered in the relevant development stages.

In summary, this report highlights:

- The subject land is capable of sustaining development in keeping with the proposed light industrial and residential development.
- The land is capable of being connected to and provided with all essential services to sustain residential development (based on current and future service authority planning).
- The proponent's strategy for the subject land will complement the natural landform by careful design of the bulk excavation, site grading and landscaping.

This report has been compiled based on the following terms of reference:

- Briefing discussions and meetings with the client.
- Site inspection and site walkover.
- Numerous discussions with Local Government Agencies.
- Site data and documents included on this report.
- Servicing concepts and Regional Strategic Infrastructure planning by the regulatory authorities.

The majority of the subject site is zoned as Light Industrial and partially residential as shown in MNG Maps in **Figure 2** below:

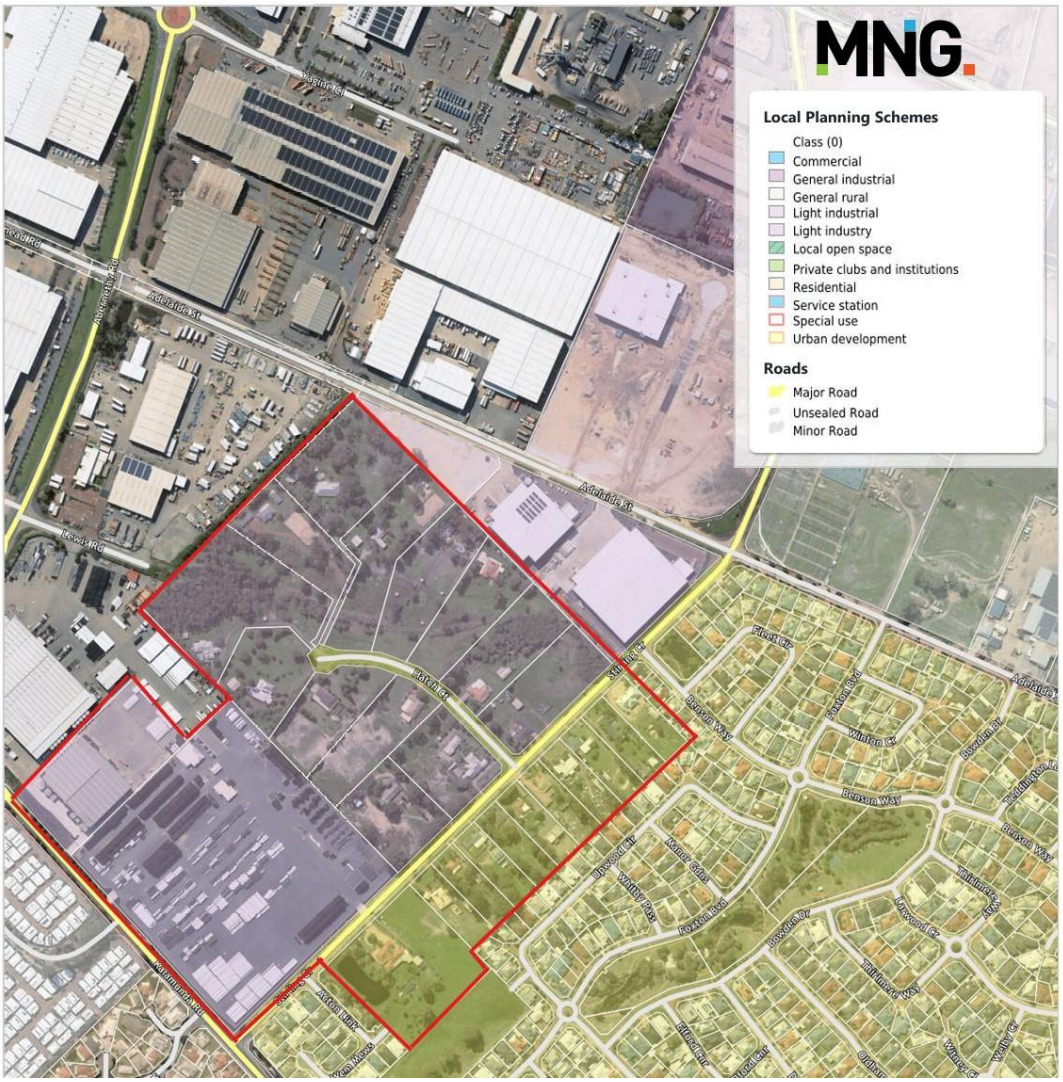

Figure 2 Town Planning Map (MNG)

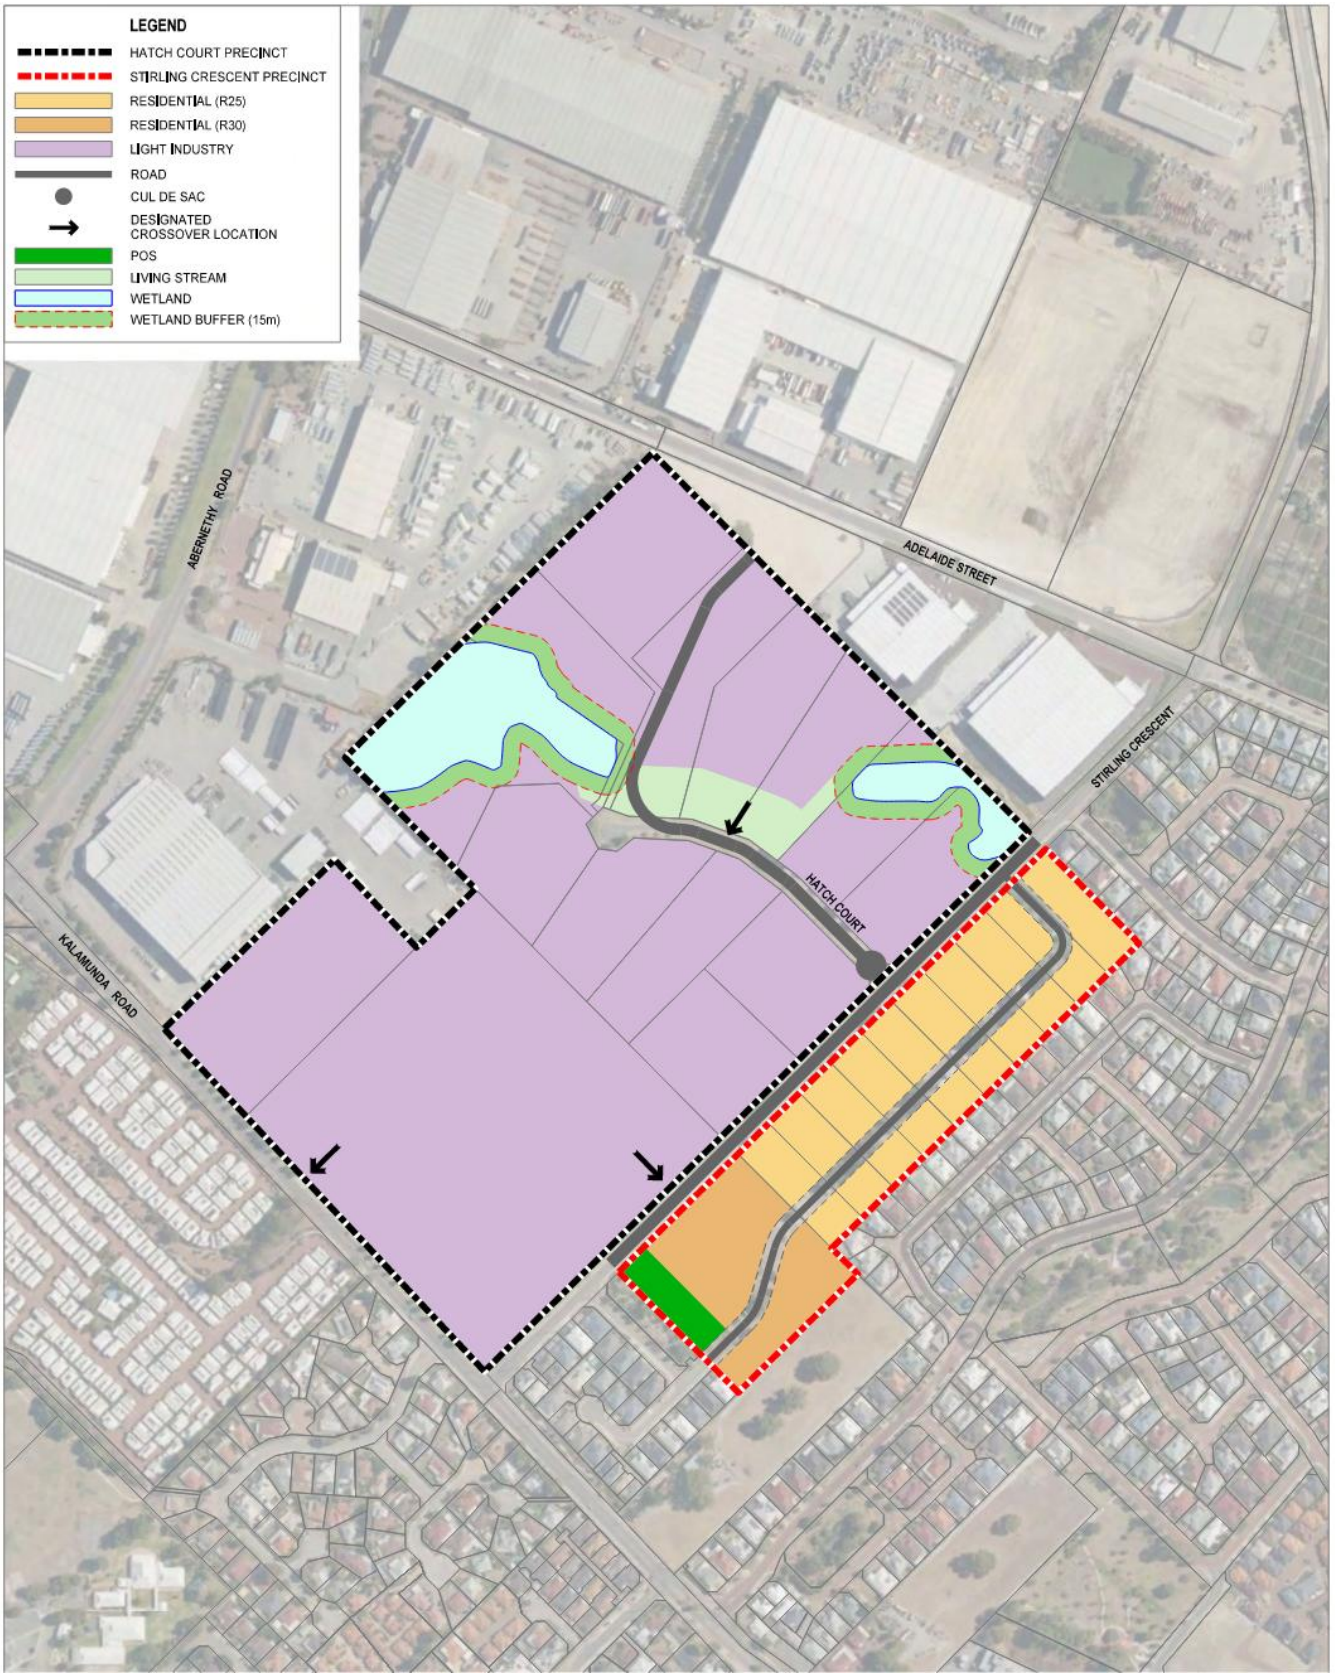
1.1 Proposed Development

The proposed development is yet to be confirmed in more detail, however, at the time of this report the subject site comprises of the following approximate land usages:

Table 1 Summary of land use areas

Total Structure Plan Area	31.882ha
Area of each land use zones: • **Residential** **Light Industry**	 4.9126ha 21.57ha
Area of reserves: • **New Road Reserves** • **Public Open Space/Drainage** • **Wetlands & Buffer** **Living Stream**	 1.4088ha 0.29ha 3.0591ha 0.6415ha
Estimated lot yield (Residential)	140 lots
Estimated dwellings	140 dwellings
Estimated density per site hectare	28.5 dwellings
Estimated population	350 residents @ 2.5 people per household.
Primary Schools	None
High Schools	None
Total Structure Plan Area	31.882ha
Estimated population	350 residents @ 2.5 people per household.

The proposed structure plan layout for the subject site can be found in Figure 3 below.



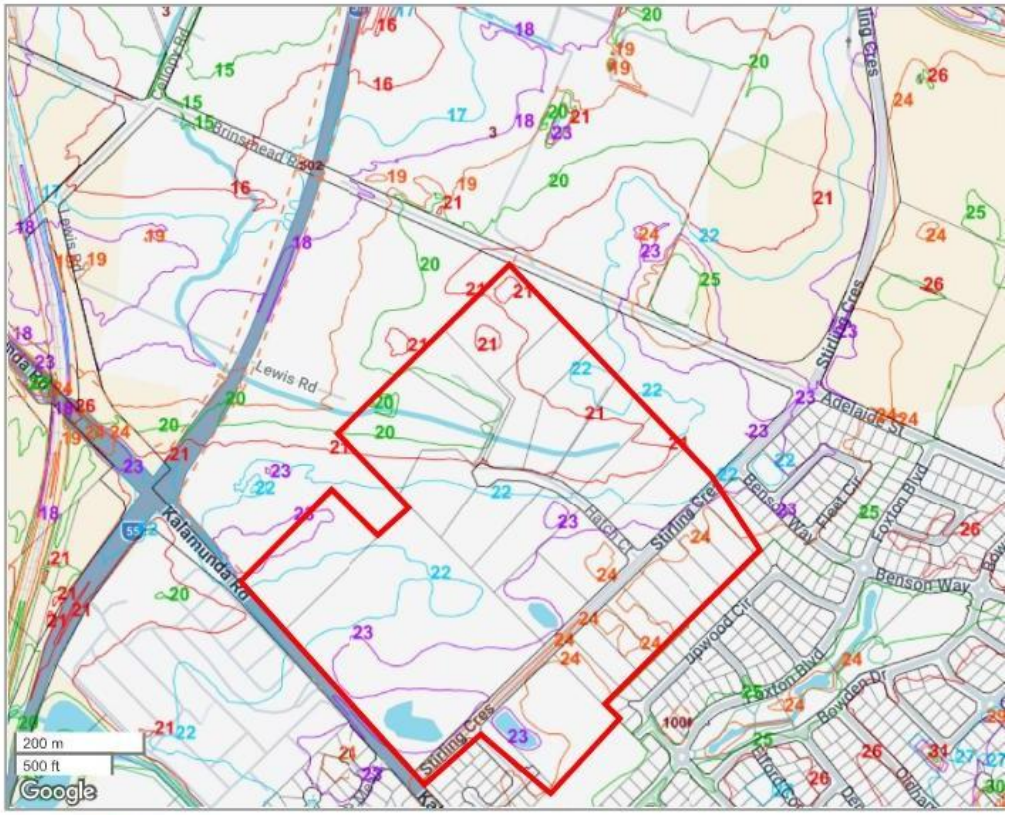


Figure 3 Draft Structure Plan Layout

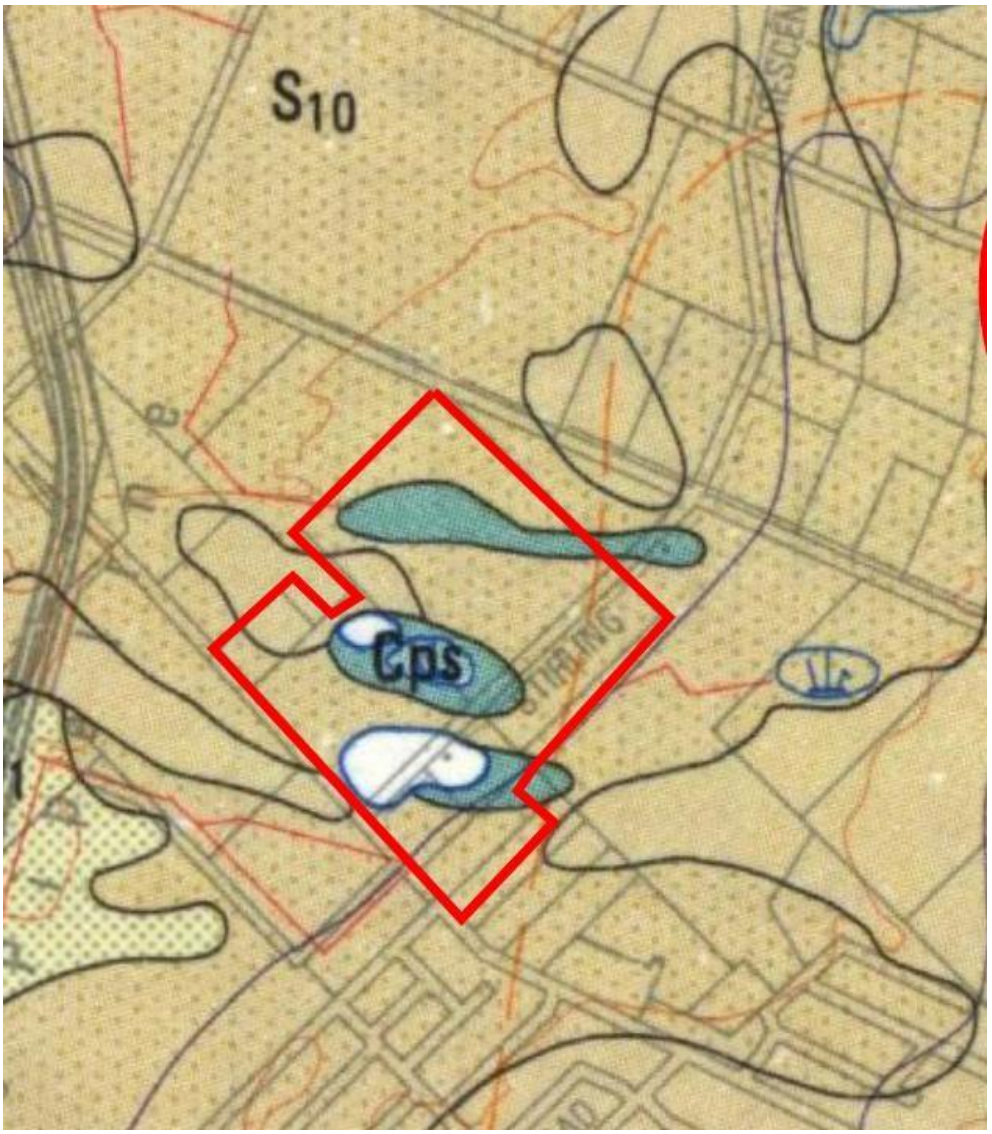
2. SITE EVALUATION

2.1 General

Within this section, a detailed summary of the existing services and constraints information has been compiled and summarized for the subject site. The detailed analysis includes a review of Dial Before You Dig (DBYD) information, aerial photography, review of DWER and DPLH Databases, Water Corporation records, and correspondence obtained from service authorities.

The general topography of the subject sites is mild sloping from east to west at approximately 1 in 50 slopes across the site. The highest point is at the intersection of Hatch Court and Stirling Crescent at approximately 24m AHD and the lowest point is over the subject site at approximately 20m AHD at the western boundary of the subject site as seen in **Figure 4** below.



© Copyright 2005 Water Corporation

Figure 4 Natural Surface Level Contours (Water Corporation ESInet 22)

Subject to final development layout, the land might require bulk earthworks to be completed to regrade the site to suit the building footprint.

2.2 Site Geology

The subject site geology can be seen in **Figure 5** below, which shows that the majority of the site is underlain by sandy soils. Within the vicinity of the existing creek corridor, a layer of organic silty sand approximately 0.8 m thick overlies the underlying sand profile. In the northern portion of the site, iron-indurated sand (commonly referred to as *coffee rock*) has been encountered at an approximate depth of 2.0 m below existing ground.

Map Unit [1]		Description
Unconsolidated Material [2]	Rock [2]	
Cps		PEATY CLAY – dark grey and black [3] with variable sand content of lacustrine origin
M_1		SILT – grey mottled yellowish brown, blocky, firm, variable clay content
P		PEAT – black, clayey in part, saturated fibrous organic soil
Sp		PEATY SAND – greyish brown, medium-grained quartz, moderately well sorted, variable organic content, of lacustrine origin

Figure 5 Site Soil Classification (Geological Survey of Western Australia)

Table 2 Summary of Geological Mapping

Map Sheet	Map Scale	Mapped soils	Site findings
Perth	1:50000	Northern portion of site underlain by a thin layer of Bassendean Sand overlying Guildford Formation Southern portion of site underlain by Swamp Deposits (Peaty Clay)	SAND (SP) overlying Coffee Rock in the northern half of site; and Organic Silty SAND (OL) overlying SAND (SP) in the southern half of site

The subject site will require further investigation during specific development phases with due regard to the proposed building pads and drainage requirements.

2.3 Previous Geotechnical Investigations

A geotechnical investigation was also undertaken by Galt Geotechnics in 2025. The key findings from the investigation reinforce the ASS study and the geotechnical study and show they are generally consistent with the geological mapping. The summary of the geotechnical assessment is specified in the table below.

Table 3 Summary of Geotechnical Assessment

Type	Clause	Parameter	Comment
Site Suitability	-	-	We consider both sites to be geotechnically suitable for the proposed development with appropriate site preparation measures. Standard site preparation measures will apply for most of the site.
Site Classification (AS2870)	GDR5	A / P	Class A for most of each site. Class P in drainage lines, wetland areas and lakes. The site classification in these areas could be improved if organics soils are removed and replaced
Site Preparation	GDR6	Ce	For most of the site: preparation will comprise GDR6.2.1 Common Measures followed by GDR6.2.2 Sand Sites. Surficial uncontrolled fill in the northern part of the site must be remediated. We anticipate raising of the site above shallow groundwater levels by importation and compaction of sand fill

			(Permeable Sand) however this is subject to civil design. In drainage lines, wetland areas and lakes. If these areas are to be developed, organic soils present in these areas will need to be removed and replaced with approved fill. Dewatering and treatment of water / soil for acid sulfates will also be required.
Footing Preparation and Testing	GDR6.4	-	We expect the base of footings at this site to be entirely within sand. We refer you to GDR6.4.1. A PSP may be used to verify compaction in footing excavations as discussed below.
Topsoil Strip	GDR6.2.1	Thickness = 100 mm	Expected thickness of topsoil strip (average).
Compaction Control	GDR7	-	Requirements for "Sand" as per GDR7 Compaction control at this site may be done using a Perth sand penetrometer (PSP). The target blow counts for "Bassendean Sand" are applicable as per GDR7.4 Perth Sand Penetrometer.
Approved Fill	GDR8	Permeable Sand or General Sand	Approved fill at this site is to comprise Permeable Sand (where stormwater disposal is required) or General Sand (where stormwater disposal is not required) as per GDR8 Approved Fill and Conformance Testing. The insitu sand is suitable for reuse as General Sand and is likely to have an unsaturated hydraulic conductivity of approximately 3 m/day when compacted. Further permeability testing of recompacted insitu sand is required to derive a design hydraulic conductivity value.
Excavations, batters and slopes	GDR12	1V:2H (temporary) 1V:3H (permanent)	Excavations in sand should be readily achievable to 2 m with 15 ton excavator or similar. The batter angles given are for slopes up to 2 m high and above groundwater. Refer to GDR12 Excavations, Batters and Slopes for more information. Dewatering will be required for excavations in lower lying areas of shallow groundwater.
Unsaturated Hydraulic Conductivity	GDR13	kunsat = 3 m/day for isolated soakwells, and kunsat = 5	k_{unsat} values apply where disposing into natural grey sand, minimum 0.5 m above the groundwater table, coffee rock layers (or overlying perched water) or black / brown sand layers near the groundwater table as per GDR13.4.

		m/day for interconnected soakwells.	
Pavement Subgrades	GDR16	CBR = 10%	For subgrades of granular pavements comprising compacted approved fill / insitu sand.
Acid Sulphate Soils	**-**		Management of acid sulphate soils is likely to be required during construction.

The soil field testing results are summarized in table 3 below.

Table 4 Summary of Field-testing results

Field pHf range	Field pHfox range	pH change	Laboratory pH range	Maximum Net Acidity
4.7 – 8.5	2.6 – 6.5	1.0 – 5.8	4.0 – 9.5	<0.02 – 0.14

2.4 Ground Water

As outlined in the Local Water Management Strategy prepared by Oversby Consulting, the following groundwater management measures are recommended for the Hatch Court Light Industrial Area:

- Surface water inflows to groundwater are to be treated via bioretention gardens and the proposed living stream / wetland network.
- Where required, development areas are to be raised using clean engineered fill to maintain adequate vertical separation from groundwater levels.
- Subsoil drainage systems are to be installed in areas where groundwater is less than 1.5 m below finished surface levels to manage seasonal groundwater rise.
- Connection to reticulated sewerage will remove potential wastewater pollutants from developed lots for off-site treatment.
- The removal of existing stock access and extensive garden areas is expected to reduce nutrient loading to the groundwater system.

Review of the Perth Groundwater Atlas (DWER) indicates that regional groundwater flow is generally in a north-westerly direction, with interpreted maximum groundwater levels reducing across the site from approximately RL 19.9 mAHD to RL 17.2 mAHD.

In addition, a 12-month groundwater monitoring program undertaken as part of the broader District Water Management Strategy investigations (ENV, 2009) included bores MW1 to MW4 located within the subject land, together with DoW Bore 4849 to the east. Based on the monitoring results, the Average Annual Maximum Groundwater Level (AAMGL) was established, with results summarised in Table 4. The broader groundwater assessment identified a general northerly groundwater flow direction.

Table 5 DWMS groundwater level results

Bore	Maximum Recorded Groundwater Level (mAHD)	Depth to maximum Recorded Groundwater Level (m)	AAMGL (mAHD)	Depth to AAMGL (m)
MW1	22.273	1.02	22.136	1.157
MW2	21.484	0.248	21.32	0.412

DoW 4849	14.937	-	14.72	-

Given the above-average rainfall experienced during 2025, groundwater levels recorded during the recent investigation period are considered likely to be representative of near-maximum seasonal conditions. Groundwater discharge was also observed into the drainage line traversing the site, which assists in limiting further groundwater rise during peak periods.

Groundwater depths are generally shallowest in proximity to the existing wetlands and drainage corridor, while depths increase to greater than 2.0 m within the elevated sand dune areas. Localised zones were also identified where groundwater was within 1.0 m of the natural surface during August / September 2025. Groundwater was additionally encountered within excavated areas on the subject land and within the adjoining POS basin. Discussions with nearby landowners indicate that groundwater levels within the southern open waterbody may fluctuate by approximately 1.0 to 1.5 m annually.

Based on observed pond water levels and available geotechnical investigation data, a refined groundwater contour assessment has been developed. This indicates groundwater levels generally fall in a north to north-westerly direction, from approximately RL 23 mAHD to RL 19 mAHD across the locality. Some minor localised groundwater mounding is also evident in areas where less permeable subsurface soils restrict vertical infiltration. These local influences are expected to diminish as seasonal groundwater levels recede below the invert level of the drainage line, allowing perched or mounded groundwater to dissipate into surrounding more permeable areas.

Groundwater quality

Groundwater sampling was undertaken as part of the geotechnical investigation program to assess baseline groundwater quality conditions across the site.

Laboratory results indicated groundwater pH values ranging from 6.18 to 7.16, which is considered slightly acidic to neutral. Mildly elevated inherent acidity was identified, together with high to very high alkalinity concentrations, suggesting the groundwater possesses adequate natural buffering capacity to maintain an acceptable pH balance in the event of Acid Sulfate Soil (ASS) disturbance or oxidation.

Elevated concentrations of aluminium and iron were also recorded, which may indicate that some degree of historical ASS oxidation has previously occurred within the site or surrounding locality. Notwithstanding this, the detected metal concentrations are generally consistent with groundwater conditions commonly observed throughout the eastern Swan Coastal Plain.

Chloride concentrations were found to exceed the applicable non-potable groundwater use guideline within monitoring bore MW01, where a concentration of 330 mg/L was recorded. This elevated chloride level may reflect local hydrogeological influences, historical land use activities, or natural saline trends within the regional groundwater system.

Overall, the groundwater quality results indicate conditions typical of the surrounding area, with no unusual anomalies identified beyond those commonly associated with seasonal groundwater fluctuations and local soil chemistry.

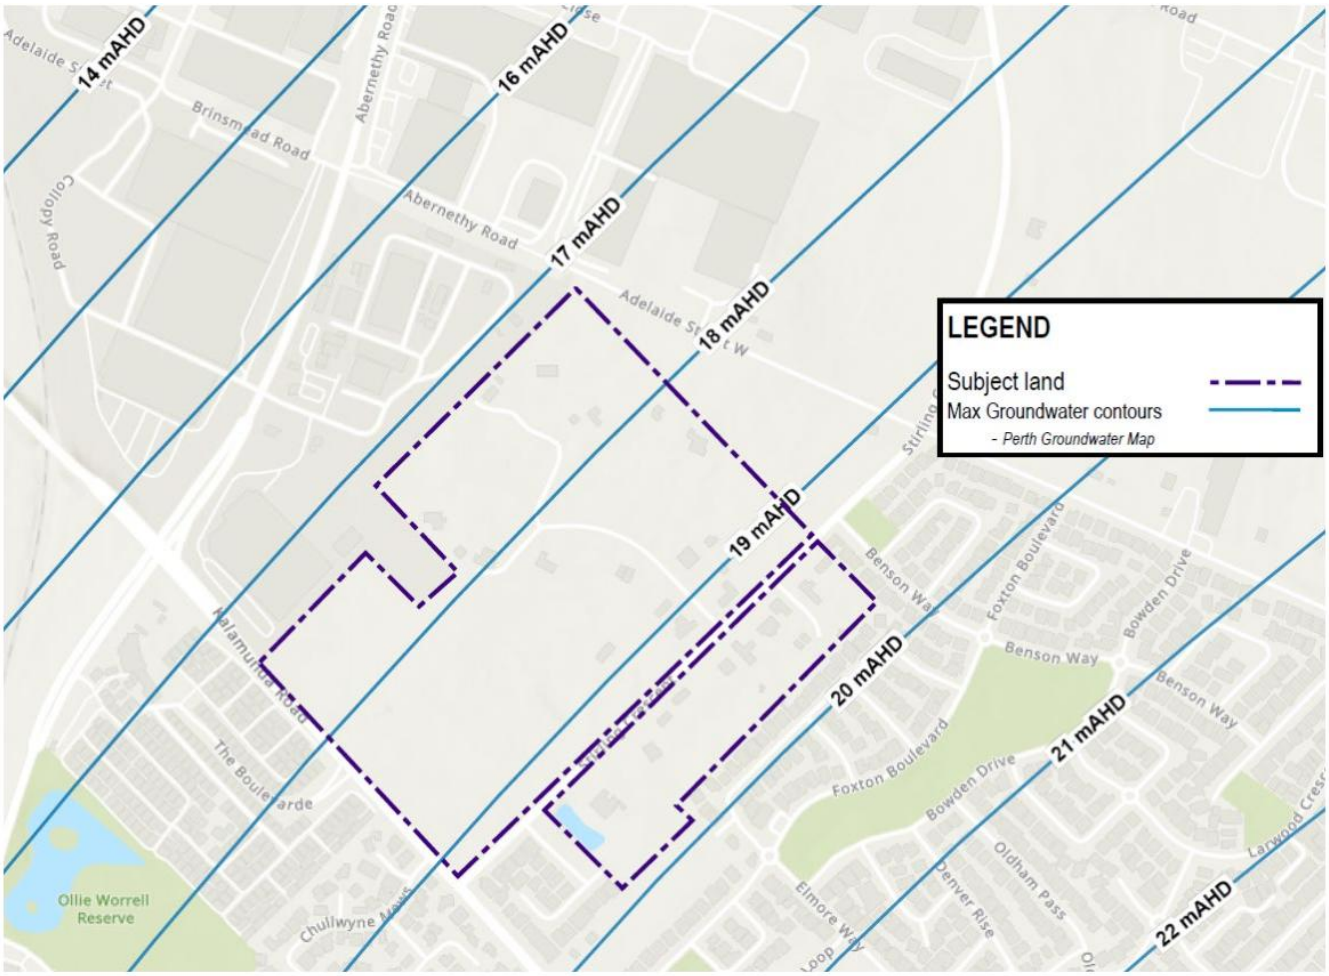

Figure 8 Predevelopment Groundwater Conditions (Perth Groundwater Map -2019)

2.5 Acid Sulphate Soils

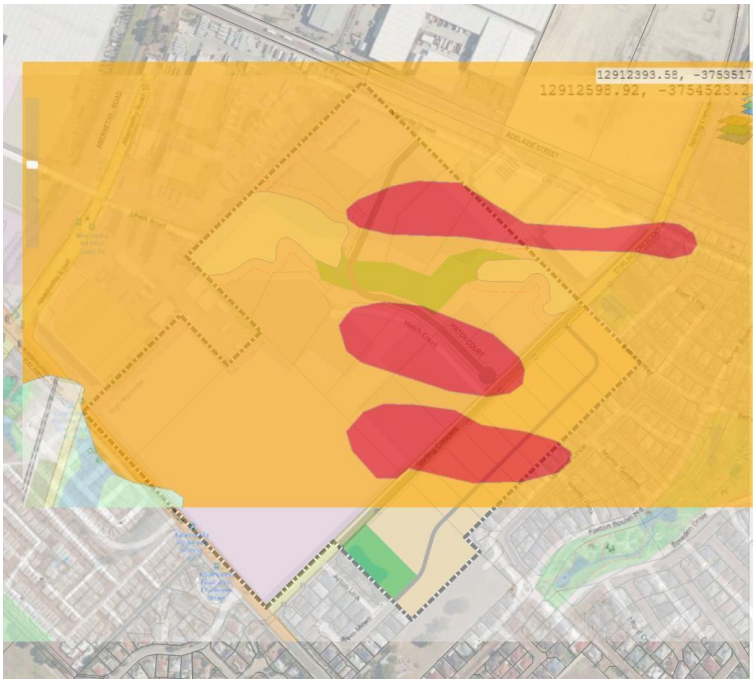

Figure 9 DWER Acid Sulfate Soils

Based on information from the DWER groundwater database, the subject site is mapped as containing areas of High to Moderate and Moderate to Low-risk Acid Sulfate Soils (ASS). Acid sulfate soil field testing and laboratory chromium reducible sulfur (CRS) analysis has since been undertaken as part of the geotechnical investigation for the site (Galt Geotechnics, WAG250138-01 001 Rev0), which confirmed that coffee rock and organic soils present within the site are considered to be ASS, consistent with the DWER mapping.

Laboratory results indicate the net acidity of tested samples was generally below the adopted action criterion (0.03%S), with the exception of one sample. On this basis, further ASS investigation and an Acid Sulfate Soil and Dewatering Management Plan (ASSDMP) may be required as part of the DA/subdivision approval process, particularly where deep excavation, dewatering or disturbance of the drainage lines/wetland/lake areas is proposed, consistent with the recommendation of the geotechnical report.

2.6 Bushfire

The current online bushfire mapping listed on the Department of Fire & Emergency Services (DFES) website demonstrates that the subject site is within a Bushfire Prone Area, as shown in **Figure 10** below. Additional planning and building requirements may apply to the proposed subdivisional development in accordance with Schedule 2 Part 10A of the Planning and Development (Local Planning Schemes) Regulations 2015, State Planning Policy 3.7, WA Guidelines for planning in Bushfire Prone Areas, and the Building Code of Australia.

Figure 10 DFES Bushfire Prone Map 2024

2.7 Environmental and Contamination

A contaminated land search on the DWER website indicates the site is not within known contaminated sites. No further actions from an environmental contamination perspective are required for the proposed development site.

2.8 Flood

Based on advice provided by the Department of Water and Environmental Regulation (DWER), the subject site at Hatch Court is not located within a mapped floodplain and is not subject to riverine or regional flood risk. DWER has confirmed that the area is not affected by major flooding associated with surrounding catchments and waterways.

Accordingly, no floodplain management measures or development restrictions associated with 1% Annual Exceedance Probability (AEP) flooding are applicable to the site. The proposed development can therefore proceed without the need for floodplain-specific mitigation measures, subject to compliance with standard stormwater management requirements and detailed drainage design to address local runoff and minor storm events.

This assessment relates to major flooding only and does not preclude the need for appropriate stormwater drainage infrastructure to manage local rainfall events in accordance with relevant authority standards.

The following advice was provided by DWER:

''We have no information on flooding or flood levels at this location. The Lots are located more than 2.6 km away from our nearest mapped watercourse, the Helena River. The proposed development is outside of the Helena River floodplain.

Please read the Better Urban Water Management guidelines with regards to stormwater design.

Better urban water management

You can also contact our Swan Avon Region for other planning advice on water and environmental matters.

Swanavon.landuse@dwer.wa.gov.au

It should be noted that this advice is related to major flooding only and other planning issues such as environmental and ecological considerations may also need to be addressed.''

3. SITE GRADING & BULK EARTHWORK

Site grading within the Hatch Court Light Industrial Area (HCLIA) and the Structure Plan area will generally be determined by the proposed building pad levels, servicing requirements, drainage infrastructure, and environmental and geotechnical constraints. Based on the available geotechnical investigation, it is anticipated that bulk earthworks will comprise a combination of cut and fill, with imported permeable sand likely to be required to raise development areas above design groundwater levels and achieve the proposed finished surface levels, subject to detailed civil design. Within drainage lines, wetland areas and locations containing organic soils, unsuitable material will require removal and replacement with approved fill prior to development. Where suitable, existing site-won sand may be reused as engineered fill in accordance with the geotechnical recommendations.

It is anticipated that the bulk earthworks for both the HCLIA and SCP will utilize suitable site-won material where practicable, supplemented by imported permeable sand where required to achieve design levels, satisfy geotechnical requirements and maintain adequate separation from groundwater. Imported fill, if required, is expected to be sourced from approved sand suppliers within the locality.

Preparatory works prior to earth working should be limited to the following:

- Removal of existing trees and vegetation
- Demolition and disposal of existing building
- Removal of fencing and other improvements as necessary.
- Stripping and grubbing of areas to be earth worked to the depth 700mm below existing ground level.
- Strip and disposal of topsoil.
- Cut to fill operations and imported fill to selected areas to suit design layout.
- Stabilisation of any areas to be landscaped or where topsoil has not been respread on verges and embankments.
- Site levels shall be set in accordance with the following parameters:
- Geotechnical and soil parameters to ensure that the site is capable of development.
- Fill levels to provide clearance to groundwater (AAMGL and as prescribed by authority approvals). Not likely to be an issue for this site however further investigations are required.
- Finished building pad levels are to be 0.5m above 1% AEP flood levels.
- If required, finished transformer site pad levels are to be set at least 1.0m above 100-year flood event.

Upon completion of bulk earthworks, any disturbed areas shall be stabilised either by respreading the stockpiled topsoil from the bulk earthwork operations or via hydro mulching stabilisation as appropriate or in accordance with the requirements of the local authority.

Estimated cut-and-fill quantities should be calculated during detailed design to optimize earthworks balance and minimize import/export costs. Additionally, site grading must be designed to ensure all finished building pads meet or exceed the minimum 0.5 m clearance above the 1% AEP flood level.

4. LAND STABILISATION AND DUST SUPPRESSION

Prior to construction taking place, a construction water supply will be established to provide water for dust suppression, temporary sand stabilisation and irrigation during the construction phases.

Water trucks and spray equipment will be on site throughout the construction programme to damp down exposed sand surfaces until the surface is physically stabilised. In the event that adjacent occupied homes or trafficked roads are affected by sand drift, a sand-trapping fence will be constructed fronting the affected section of the development.

All dust suppression activities should comply with the City of Kalamunda's dust control regulations. Daily monitoring of dust emissions should be implemented during earthworks to ensure adherence to local environmental health requirements.

In the event of strong winds blowing towards adjacent properties that cause blown sand to reach those properties, earthworks, including the stripping or respreading of topsoil, will be temporarily suspended and dust suppression measures immediately implemented.

Stabilisation of the soil surface will be carried out, as required, immediately following topsoil re-spreading and minor regrading. Soil stabilisation will be maintained until such time as the building construction commences.

5. ROAD NETWORK & TRAFFIC CONSIDERATIONS

5.1 Vehicular and Pedestrian Access

The subject site is accessed via Hatch Court, which connects to the wider local and regional road network through Stirling Crescent. The existing Hatch Court road is a 6.0 m sealed carriageway constructed within an 18 m road reserve.

The site is located in close proximity to key regional transport corridors, including the Great Eastern Highway Bypass, Roe Highway, Kalamunda Road and Abernethy Road, which together provide strategic connectivity to the broader metropolitan and industrial road network.

The construction of a proposed 20 m road reserve linking Hatch Court to Adelaide Street will provide a direct connection between the Hatch Court Light Industrial Area (HCLIA) and the regional road network. This new link will enable industrial Restricted Access Vehicle (RAV) movements from Hatch Court to Abernethy Road via Adelaide Street. To support this function, the existing bitumen seal along Hatch Court will require widening to approximately 10m and may require pavement upgrades to accommodate increased traffic volumes and heavier industrial vehicle loading.

The State Government, through Main Roads Western Australia, is proposing major road infrastructure upgrades that will significantly enhance industrial vehicle access to the HCLIA. These works include the Great Eastern Highway Bypass Interchange Project, which will upgrade the interchanges at Roe Highway and Abernethy Road, as well as the extension of Adelaide Street through to Abernethy Road.

In addition, the City of Swan proposes to construct a new roundabout at the intersection of Stirling Crescent and Adelaide Street, with the intent of directing industrial vehicle movements from the

Hazelmere Industrial Area to Abernethy Road via Adelaide Street. This will reduce reliance on Kalamunda Road for industrial traffic accessed via Stirling Crescent.

Collectively, the proposed transport infrastructure upgrades are expected to significantly improve industrial access, efficiency and safety for the subject site and the broader HCLIA.

However, these upgrades are being delivered by the City of Swan and Main Roads WA as part of a broader regional programme, and their construction timing is not within the control of the applicant. Should the delivery of the Stirling Crescent/Adelaide Street roundabout, or other associated regional road upgrades, not align with the staging of the proposed subdivision, there is a risk that interim access arrangements may be required to maintain safe and functional vehicular access to the site in the short term.

To manage this risk, it is recommended that the applicant maintain ongoing liaison with the City of Swan and Main Roads WA to confirm the anticipated delivery programme for the regional road upgrades, and that this be reviewed and reconfirmed at each stage of subdivision to ensure the development's access arrangements remain appropriately coordinated with the broader infrastructure programme

Alternately opening up Adelaide Street to Abernethy Road, then access along Stirling to GEH Bypass could still remain open for industrial vehicles out of the HCLIA.

The existing road network is shown in **Figure 11** below.

Figure 11 Existing Local Road Network

A formal Traffic Impact Assessment (TIA) has been prepared to support the Local Structure Plan which details the relevant road network upgrade needs and confirm access arrangements.

5.2 STORMWATER DRAINAGE

An existing double side-entry stormwater pit is located along Hatch Court and is connected via a 300 mm diameter pipe to the existing drainage easement within the subject site. The majority of stormwater runoff from Hatch Court is conveyed to this side-entry pit. However, runoff generated from the cul-de-sac head currently flows back onto adjoining private property.

No additional stormwater drainage infrastructure has been identified within Hatch Court.

Stormwater Management Approach

Preliminary hydrologic and hydraulic modelling was undertaken by Brendan Oversby to inform the LSP planning and ensure post-development compliance with drainage and floodplain requirements set by DWER.

Key elements include:

- Surface water is managed through vegetated swales, park avenues, and living streams.
- Detention storage will be utilized throughout the site to ensure post-development peak discharges are reduced or maintained relative to pre-development.
- All modelling and strategy development to align with:
    - Stormwater Management Manual for Western Australia (DWER)
    - Decision Process for Stormwater Management in WA (DWER, 2017)
    - Peak discharge and storage targets based on DWER floodplain benchmarks.

Design of drainage swales and open channels within or adjacent to road reserves must comply with DWER & Council guidelines to ensure both hydraulic performance and vehicle safety. The key safety considerations relate to swale depth, batter slopes, and the risk of vehicle rollover or occupant drowning in the event of an accident.

Considerations include:

- Water depth not to exceed 0.6 m, or
- Side slopes are steeper than 1:4, or
- Both criteria are combined and present rollover or submersion risk

5.3 SUBSOIL DRAINAGE

Based on predevelopment groundwater levels, Peritas recommends the installation of subsoil drainage to manage potential groundwater rise associated with post-development lot fill.

Subsoil drains are proposed beneath the road reserves, designed with a minimum longitudinal grade of 1:500 to ensure gravity flow and effective groundwater control. To maintain system performance and constructability, road levels must be designed with at least 1.2 meters of clearance above the invert level of the subsoil drainage pipes.

Subsoil discharge will connect into the main drainage conduits within the adjacent swales, which ultimately outfall to the nearest waterway.

Final pipe sizing and configuration for the slotted subsoil drains will be confirmed during detailed design, in consultation with the hydraulic consultant, and will be based on site-specific groundwater conditions and expected seasonal flows.

5.4 WASTEWATER DISPOSAL

Development to date within the Hatch Court Local Infrastructure Area has proceeded with onsite effluent disposal, as the site is not currently connected to a reticulated sewer network, with the nearest existing sewer infrastructure located a significant distance from the site. Existing Water Corporation sewer reticulation in the subject site vicinity can be found in **Figure 12.**

Existing Infrastructure and Proposed Extensions

The nearest sewer infrastructure to the SCP is a DN150/225 reticulation sewer near the intersection of Acton Link & Stirling Crescent, Wim Mews and is also available at Benson Way / Stirling Crescent, however this infrastructure is too high to serve the subject site by gravity.

Ultimately the subject land is part of a sewer catchment that gravitates to the regional wastewater pump station located near the corner of Abernethy Road and Worrell Avenue.

A DN225 gravity main is planned along Abernethy Road heading north to Lewis Road and then eastwards into the subject site.

The internal gravity network within the SCP is expected to include reticulation mains of DN225, depending on location and topography. These mains will be sized to accommodate flows from future development areas including the residential zone south of Stirling Crescent.

The delivery of the external sewer extension to the site will be expensive and may only be developed based on development demand downstream or by owners within the LSP catchment contributing to the sewer extensions to the area (Unlikely that this cooperation will occur).

A pump station and rising main were also considered as an alternative to the gravity extension, however, this option was found to be cost prohibitive when compared to the gravity sewer extension, factoring in both capital costs and the ongoing operational and maintenance costs associated with pump station infrastructure. As such, extension of the gravity network remains the preferred approach, subject to development demand and/or catchment owner contribution as noted above.

Interim Infrastructure Considerations

There may be an opportunity to service a portion of the residential portion of the site but Water Corporation has previously advised that this is outside of the approved catchment to the south and would not be considered at this time. More formal approaches to Water Corporation will be required in the future to secure the appropriate approvals which we believe are technically possible.

In order to service the residential portion of the LSP area, a significant portion of the proposed residential development is anticipated to require fill to achieve adequate cover over the sewer network discharging to the north-east (Benson Way) and south-west (Stirling Crescent/Acton Link). Further assessment will be required during the detailed planning and design phase to optimize the lot layout, finished levels and sewer alignment. It is anticipated that residential lots adjoining Stirling Crescent will be configured as rear-loaded lots, with vehicle access provided via an internal 6m laneway, rather than fronting Stirling Crescent. This approach will influence the overall lot yield, internal road layout, earthworks requirements and development outcomes, and will require further consideration during detailed subdivision design.

This could be accommodated with a conforming fencing arrangement as provided in other major residential estates. Appropriate design of the wall and potentially landscaping would reduce the impact of the structure required along the Striling Crescent interface that would have the rear of the lots along that boundary.

The industrial/commercial portion of the site will most likely be developed as a dry industry and wastewater treated on site utilizing proprietary ATU technology and associated soakage field disposal.

Delivery Strategy and Developer Requirements

Subject to development staging and regional demand will be dependent on:

- Negotiation with adjacent landowners
- Creation of sewer easements where required
- Development approvals over third-party land

Ongoing engagement with Water Corporation will be essential to confirm:

- Preferred alignment
- Servicing timeframes
- Staging of infrastructure delivery

Early liaison is strongly encouraged at the structure planning or preliminary subdivision design stage to ensure servicing requirements and land access arrangements are well understood.

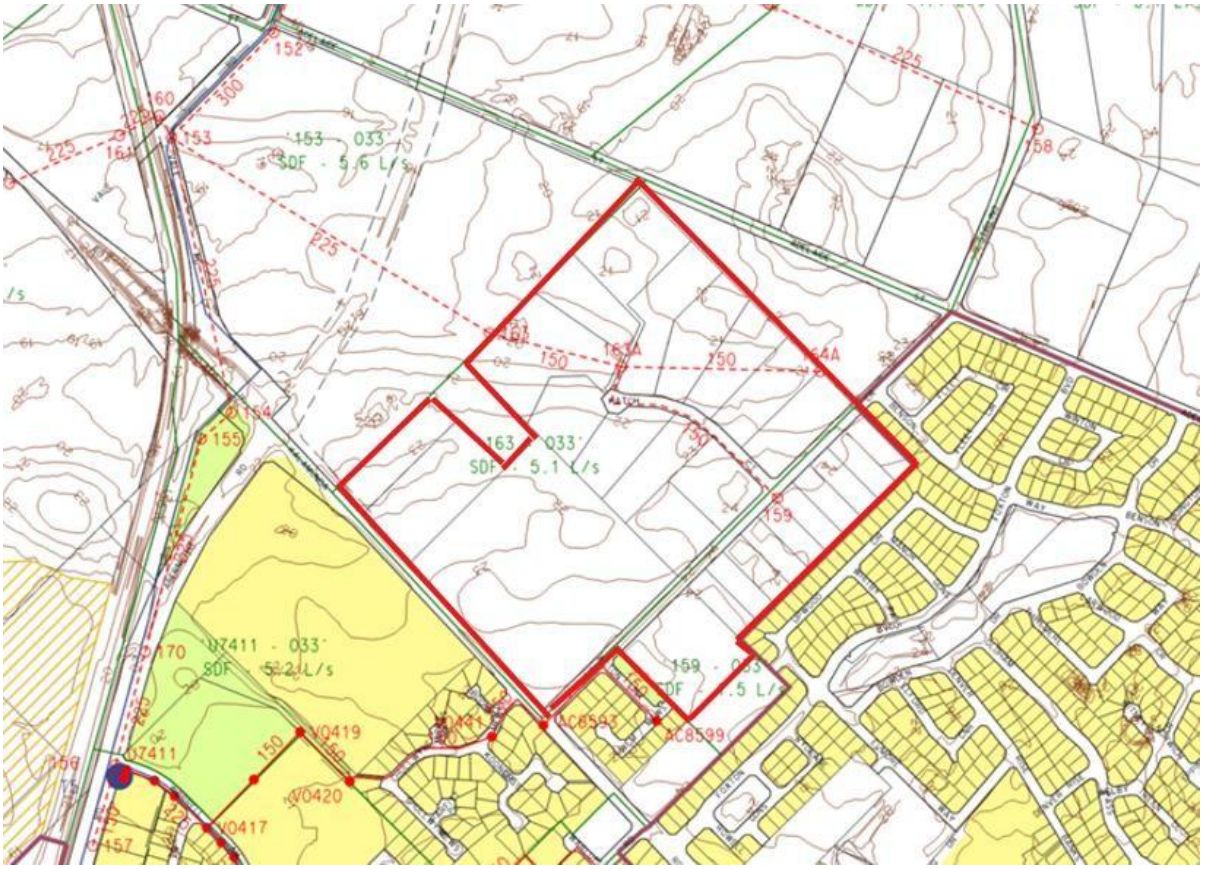

Figure 12 – Existing Water Corporation Wastewater Planning

5.5 POTABLE WATER SUPPLY

The following advice was provided at a meeting with Water Corporation in regard to potable water reticulation:

Whilst the current area is serviced by reticulated water supply, the mains are sized for the current zoning which is predominately rural and therefore would require upgrading. The will apply to both the SCP and the HCLIA areas.

When the area is developed, upgrading of water mains will be required to provide the required capacity to the developed lots (both residential and industrial).

Please note the extract below from the current ESINET planning (Refer **Figure 13** below). The mains will be required to be constructed as part of the subdivision process of this or other proposed developments in the surrounding area.

The plans confirm the presence of existing Water Corporation reticulation and distribution mains throughout the Hatch Court light industrial precinct and surrounding road network.

The existing water supply infrastructure servicing the Hatch Court and Stirling Crescent area is not expected to present any significant constraints to the proposed upgrade works within Hatch Court. A 100 mm cast iron (100CI) water main currently runs along the Hatch Court alignment, providing reticulation to the existing lots, with individual property service connections evident from aerial imagery. The presence of this asset will need to be considered during detailed design and construction planning to avoid service disruptions; however, its location is known and can be managed through standard construction practices and utility protection measures.

While the existing network configuration suggests that there is capacity available to accommodate further industrial development, the extent of any spare capacity cannot be quantified based solely on asset size and location. Confirmation of the available capacity, and the ultimate servicing requirements of the proposed industrial development, would require consultation with Water Corporation and/or a hydraulic network assessment to verify that the existing system can support the anticipated development demand.

Along the Stirling Crescent corridor, a 100mm cast iron (100CI) reticulation main is present, consistent with the distribution network serving the established residential and light industrial lots fronting this road. Larger transmission and distribution mains in the vicinity include a 250mm P-12 main and a 100mm P-12 main running generally northwest–southeast along the Stirling Crescent and Fleet Crescent alignments, serving the broader precinct.

In the broader area around Kalamunda Road, significant Water Corporation infrastructure is present including a 225mm cast iron (255CI) main, a 150mm P-12 main, and a 100mm steel (100S) main running within or adjacent to the road reserve. These represent part of the trunk distribution network for the area.

Also notable within the wider study area is a 250mm P-12 main along the Adelaide Street / Hatch Court interface, and an 180mm MDPE main in the northern portion of the precinct.

All main water extensions for the subject area must be laid within the existing and proposed road reserves, on the correct alignment and in accordance with the Utility Providers' Code of Practice.

Existing water mains are located within the subject area. (Please note plan of existing assets attached) water mains should not be located in private land and should be in and protected by reserves (i.e. road reserves).

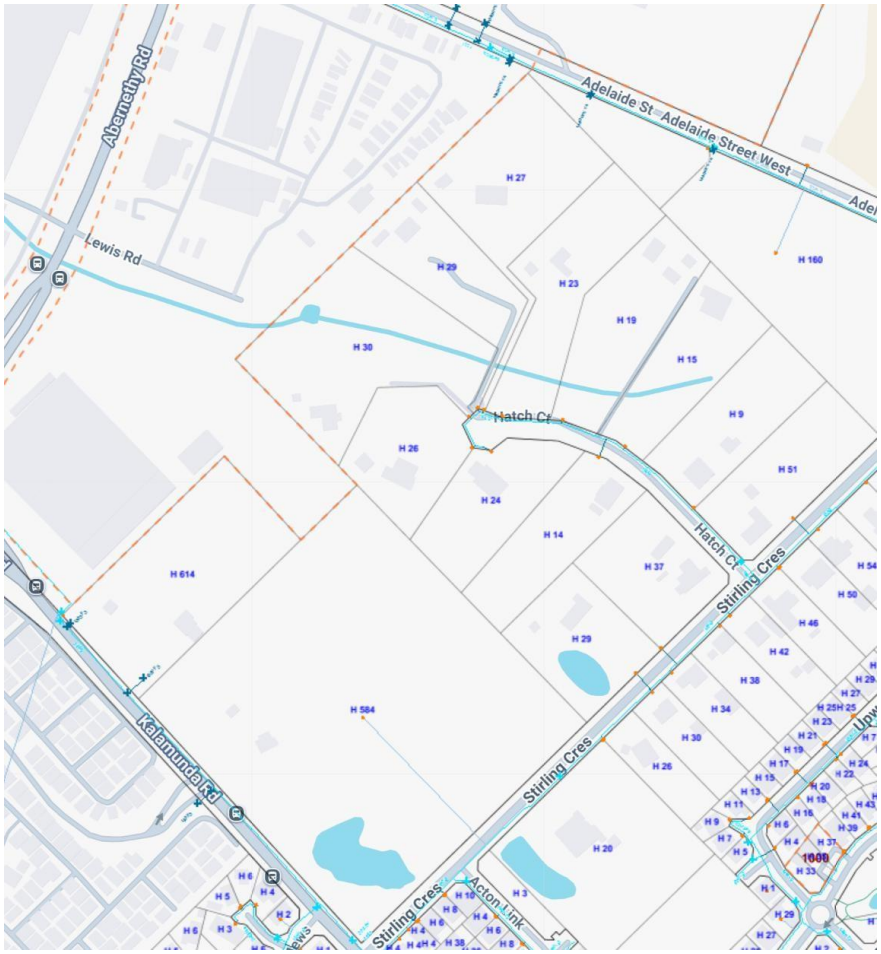

Figure 13 – ESINET Water

5.6 POWER, TELECOMMUNICATION & GAS

5.6.1 Western Power

A Western Power overhead and underground asset search was undertaken for the subject area. The plans identify existing overhead powerlines within and adjacent to the Hatch Court precinct, including High Voltage distribution lines (1 kV – 33 kV) running along Stirling Crescent, and a Transmission line (33 kV – 330 kV) traversing the broader area in a northwest–southeast alignment. Low Voltage overhead lines (< 1 kV) are also present servicing existing lots.

The underground HV/LV plan confirms the presence of underground High Voltage cables (1 kV – 33 kV), Low Voltage cables (< 1 kV), street light circuits, and associated pillars and terminations within the local road network, including along Stirling Crescent and adjacent streets.

A proposed Design Area is indicated near the Adelaide Street / Stirling Crescent intersection, suggesting active or planned Western Power works in this vicinity. Prior to any excavation or construction works, hand exposure via pothole method is mandatory in the vicinity of underground assets.

It is anticipated that all lots within the proposed development will be served with underground power. The cost of this work will need to be met in full by the developer. Western Power requirements will apply.

It is likely that a number of pad mount sites will be required throughout the development, however, due to the range of sizes of lots proposed within the development, it is not envisaged that there will be a problem in providing the sites strategically located to meet both Western Power design requirements and the requirements of the developer.

The street lighting throughout the development shall provide effective illumination for both pedestrian and vehicles.

5.6.2 Telecommunication Services

At Hatch Court, the plans confirm in-service/constructed NBN™ conduit running along the Hatch Court Road reserve, with multiple pit structures present at lot frontages providing individual property connections. The conduit appears to service the existing lots within the court, with pits distributed at regular intervals along the alignment.

Along Stirling Crescent, NBN™ conduit infrastructure is present with pits and direct-buried cables distributed along the road reserve. Multiple conduit runs are visible, consistent with both the existing Telstra-owned (PO) PVC conduit and NBN-owned (P40) 40mm PVC conduit running in the same corridor. Pit spacings are generally 20–25 m apart. A pillar (orange symbol) is also shown near the Stirling Crescent / Winton Crescent intersection, indicating a network aggregation point for the surrounding residential area.

Along the Kalamunda Road corridor, the plans show NBN™ conduit and pit infrastructure running generally parallel to the road reserve, with conduit connections branching to service the surrounding lots. This is consistent with the established network serving the residential and light industrial subdivision in the area.

Information from Telstra indicates there is a service network within the area. It is anticipated that all lots within the proposed development will be served with Telstra Telecommunication services.

Telstra will design (developer to pay) and provide details for the installation of a pit and pipe network at the cost of the developer the new telecommunication network facilities to the proposed lots. Alternatively, where cable routes match power underground supply routes, Telstra will wherever possible use the Western Power trenches in lieu of the developer providing additional trenching.

Telstra or other communications providers will cable the development once development has commenced in the area and applications are made by the land owners for communications services to their development. Headwork charges for Telstra services extensions are anticipated.

5.6.3 Gas Supply

At Hatch Court, a 50mm PVC distribution main (MAOP 70 kPa, natural gas) is present, with individual service connections to existing lots.

Along Stirling Crescent, multiple gas assets are present in close proximity, including a 155mm PVC distribution main (MAOP 70 kPa, NG) and a CRITICAL high-pressure 150mm steel transmission pipeline (MAOP 1,900 kPa, NG). The critical asset is noted to be approximately 0.9 m deep at a deviation point, and 1.5 m deep either side of the deviation. A 155mm PVC main (MAOP 70 kPa) is also present. Individual service connections serve adjoining lots along this alignment.

Along Kalamunda Road, a 160mm PE distribution main (MAOP 70 kPa, NG) is present, along with a CRITICAL 160mm PE pipeline (MAOP 700 kPa, NG) and a CRITICAL 150mm steel pipeline (MAOP 1,900 kPa, NG).

A Critical Asset Warning applies to this area. No works within 15 metres of the critical assets are permitted without prior written approval from ATCO Gas Australia. Hand exposure via pothole method is mandatory prior to any excavation in the vicinity of these assets. The project team must contact ATCO Gas Australia directly before commencing any works.

ATCO Gas has advised that reticulated gas services are available in the surrounding area.

ATCO Gas may provide road crossing conduits for future use; however, this is subject to cost allocations and budgets being approved by the gas authorities.

Please refer to the attached plans in **Appendix C** for further information regarding gas assets.

6. CONCLUSIONS & RECOMMENDATIONS

All essential infrastructure services—water, drainage, power, and gas can feasibly be extended to service the site. However, given the site's position at the edge of the current servicing envelope, careful coordination and early planning will be required, particularly where upgrades or infrastructure extensions are necessary.

Peritas recommend ongoing liaison with the relevant authorities to address infrastructure delivery, land access, and network capacity issues early in the planning process, including confirmation of the timing and delivery arrangements for the reticulated sewer connection required to service the Structure Plan (SCP) area.

This is especially important for a stand-alone development, where cost apportionment and timing of broader infrastructure upgrades, particularly delivery of the reticulated sewer to service the SCP, may pose constraints if not addressed proactively.

Further Investigations and Key Next Steps

The recommendations listed below are intended to identify the additional work streams that may be required to facilitate the orderly progression of the Local Structure Plan (LSP) through the statutory planning process and subsequent subdivision and development stages. They are not necessarily all prerequisites to Council's consideration of whether the LSP should be advertised.

At this stage, the servicing report has been prepared to provide a high-level assessment of the site's servicing opportunities and constraints to inform the LSP. The recommendations identify matters that may require further investigation or confirmation as the planning and development process advances.

1. Liaise further with Water Corporation regarding water and sewer connection strategies, including potential temporary solutions based on staging and coordination with neighbouring developments.
2. Consult Western Power to identify suitable connection points and determine the need for Earth Potential Rise (EPR) or Low Frequency Induction (LFI) assessments.
3. Coordinate with the Western Power transmission team to confirm easement requirements under high-voltage lines.

Since preparation of the servicing report, preliminary consultation has been undertaken with relevant servicing authorities to identify the presence of existing infrastructure and any obvious constraints affecting the site. The outcomes of these investigations have informed the conclusions of the report, namely that the site is capable of being serviced; however, further detailed assessment and confirmation by the respective authorities will be required as the proposal progresses through later planning and development stages.

Accordingly, the recommendations should be viewed as a roadmap for the next phase of investigations rather than as outstanding matters that prevent Council from considering the LSP for advertising. Any requirements identified through agency referrals during the advertising process can be addressed prior to final adoption of the LSP or as conditions of subsequent subdivision approvals, as appropriate.

Priority Recommendations:

Post-LSP Progression
Finalize servicing alignments, including confirmation of reticulated sewer delivery to service the Structure Plan (SCP) area.
Acid sulfate soil (ASS) testing & Management Plan as part of subdivision development.
Asset relocation and protection coordination.

Early and proactive engagement with major service authorities is recommended to confirm detailed requirements for:

- Confirm servicing capacities and connection strategies
- Clarify potential infrastructure upgrades
- Enable coordinated forward works planning and budgeting

In summary, the subject site presents a viable and serviceable urban development opportunity. With further detailed investigation and ongoing stakeholder collaboration, the site can be delivered as a high-quality, fully serviced development precinct.

Standard Geotechnical Definitions, Recommendations, Requirements and Limitations

1. INTRODUCTION

This report presents the outcomes of Galt Geotechnics' (Galt's) geotechnical and acid sulfate soils (ASS) study for the proposed Hatch Court Light Industrial Area (HCLIA) and Stirling Crescent Precinct (SCP), at Hatch Court and Stirling Crescent, High Wycombe ("the site").

This report is to be read in conjunction with the appended "Geotechnical Definitions, Recommendations, Requirements and Limitations". 'Clause GDR1', etc. refer to this Appendix, found at the back of this report.

2. KEY FINDINGS

Over most of both sites, **we encountered SAND, extending to depths of 2.0 m to over 6.2 m, overlying Guildford Formation** (interbedded stiff to hard cohesive soils and medium dense granular soils) at some locations extending beyond investigated depths. In addition to the above:

- The surficial **sand is interbedded with Cemented sand / 'Coffee Rock' layers** (about 0.3 m to 1.0 m thick) below about 2.0 m to 3.4 m depth. Associated uncemented zones of discoloured brown / black sand with a higher fines content were also encountered in some locations.
- **Peat / organic soils were encountered** within / adjacent the drainage line in the northern part of the HCLIA site, and within the wetland area near Lewis Road (refer Figure 1). Similar zones of organic soils could be present in lakes at the site (refer Figure 1).
- **Surficial uncontrolled fill about 1.1 m thick was encountered** in the northern corner of site at 27 Hatch Court within the HCLIA (refer Galt report referenced: WAG250256-01 001 R Rev1).

The locations of encountered coffee rock, Guildford Formation and organic soils are summarised in Attached Tables 3 to 7.

Groundwater was encountered at depths ranging from the ground surface to over 3 m. Groundwater was also observed in lakes in southern part of each site, and along drainage line in northern part of HCLIA site.

The sites are considered broadly geotechnically suitable for the proposed development (LSP amendment to industrial use). Standard site preparation measures for sand sites will apply for most of the site area. However, geotechnical challenges relevant to the proposed development are summarised as follows:

- **Peat / organic soils must be removed** if these areas are to be developed. Removal of these soils is likely to require dewatering. Management / treatment of organic / acid sulfate generating soils and acidic groundwater could also possibly be required (refer Section 12);
- **Cemented sand / 'Coffee Rock' layers could have a low permeability**, which could impact the performance of soakwells. Coffee rock also has the potential to be acid generating (if removed) and would require treatment (refer Section 12);
- **Areas of shallow groundwater have been identified** in lower lying areas. Shallow groundwater will impact temporary excavations, and compaction during construction. Dewatering is likely to be required, particularly if construction is undertaken during winter. The potential requirement for and ASSDMP is discussed in Section 12. Shallow groundwater will affect the performance of soakwells and effluent disposal. Control of groundwater levels at the site must be assessed by a suitably qualified civil engineer / hydrogeologist. Subsoil drainage could possibly be required;
- **Surficial uncontrolled fill in the northern corner of the site must be removed**, assessed by a suitably qualified engineer and environmental scientist (refer Section 12), and either removed from site, or (if suitable) reused as approved fill; and
- **Environmental considerations are** discussed in Section 12.

We do not consider that the sites are geotechnically unusual in the context of the nearby area and similar industrial developments. We do not consider that there are any major contamination encumbrances to a proposed rezoning.

3. SITE DESCRIPTION

Table 1: Summary of Site

Item	Comment
Site Extent	Refer to In-line Image 1.
Site Area	Hatch Court Light Industrial Area (HCLIA): ~30 ha (16 lots). Stirling Crescent Precinct (SCP): ~6 ha (11 lots).
Current Site Surface Elevation[1]	Around RL 20 m AHD at the north to RL 24 m AHD at the south.
Vegetation	Vegetation present in landscaped areas surrounding houses and associated infrastructure. Vegetation includes grassed areas, some mature trees and some bushes (refer Figure 1). Dense vegetation along drainage line in northern part of HCLIA site.
Current Land Use	Mostly rural-residential developments and associated infrastructure. South west part of site (Lots 614 and 584) is a hardstand area (refer Figure 1).
Site drainage	Drainage line traverses from west to east in northern part of HCLIA site. Wetland area present in western corner of HCLIA site near Lewis Road. Several damp lands are apparent from historical aerial photos (refer In-line Image 2). Localised lakes are present in southern part of both the HCLIA and SCP sites, which are judged to be expressions of groundwater.
Site History[2]	**Prior to 1979**: Site mostly pastoral / agricultural land. Three residences developed on site. **1979 to 1983**: Development of residential buildings in SCP. **1983 to 1995**: Development of Hatch Court. And associated residential lots / developments. **1995 to 2018**: Site relatively unchanged. Some additional residential buildings and associated infrastructure constructed progressively during this time. **2018**: to Construction of hardstand in western corner of site. **2018 to 2024**: progressive construction of hardstand in western part of site (Lots 614 and 584).

NOTES: ***1.*** *Site elevation based on publicly available data (Landgate).*

2. *Site history based on aerial imagery (Landgate).*

In-line Image 1: Approximate extent of subject area

In-line Image 2: Aerial photo of site in 1961. HCLA marked in red/yellow.

4. PROPOSED DEVELOPMENT

Table 2: Summary of Proposed Development

Item	Comment
Proposed Development	LSP amendment to facilitate subdivision of industrial lots with associated infrastructure
Cut/Fill	Assumed typically up to about ± 1 m. Fill is generally anticipated to be required in low lying areas to achieve adequate clearance to groundwater.
Assumed Retaining Walls	Gravity walls up to about 2 m high
Assumed Stormwater Disposal	Possibly on site via soakwells with overflow to regional drainage.
Assumed Sewage Disposal	On site via leach drains

5. PROJECT OBJECTIVES

The objective of the geotechnical study is to assess the geotechnical suitability of the site for the proposed development. Our scope is limited to undeveloped portion of the HCLIA (i.e. excludes Lots 614 and 584)) and entirety of the SCP.

The objectives of the environmental assessment are to investigate the risk of acid sulfate soils (ASS) across the site through soil and groundwater analysis and provided recommendation for the treatment of ASS of groundwater (if required). No specific infrastructure is proposed at this stage, therefore the assessment is high level for the general assessment of ASS.

Comment is also required on the potential contamination risk within the HCLIA and SCP.

6. PREVIOUS STUDIES

Galt has previously undertaken a number of geotechnical studies for individual lots within and adjacent the site as summarised below:

- **Located within site:**
  - 27 Hatch Court in May 2025 (report reference: WAG250256-01 001 R Rev1);
  - Lots 8 and 16 Stirling Crescent in November 2024 (report reference: WAG240438-01 001 R Rev2);
- ***Located north of site / not within site:***
  - 71 Stirling Crescent in March 2023 (report reference: WAG230133-01 001 R Rev1); and
  - Part of Lot 1499 Stirling Crescent in September 2023 (report reference: WAG230463-01 002 R Rev1).

Test locations from the above reports are shown on Figure 1. Relevant information from the above studies are incorporated into this report.

7. FIELDWORK

7.1. General

Fieldwork was carried out on 25 August and 05 September 2025 and is summarised below.

Table 3: Summary of Fieldwork

Type	Results Appendix	Summary	GDR Clause	Equipment Used	No. Tests	Depth Range (m)
Site Plan	Figure 1	-	-	Hand held GPS[1]	-	-
Photographs	A	-	-	-	-	-
Cone Penetration Tests (CPTs)	B	Section 9.4	GDR3.2	Pagani TG 73-200	16	2.34 to 5.20
Boreholes (BH)	C	Section 9.4	GDR3.3	EVH Scout on utility / 7822DT / Hand Auger	14	1.30 to 3.00
Monitoring Wells (MW)	C	Section 7.3	-	7822DT	3[2]	3.00
Constant Head Permeameter Tests (G)	D	Section 7.2	GDR3.8	Guelph Permeameter	7	0.38 to 0.57

NOTES: ***1.*** *Hand held GPS is accurate to ±5 m.*

2. *One groundwater monitoring well location was unavailable for sampling after installation.*

7.2. Permeability Test Results

Table 4: Permeability Test Results (Constant Head)

Test Location	Soil Description	Depth (m)	Minimum Saturated Hydraulic Conductivity, k_{sat} (m/day)	Soil Category[2]
G01/BH01	SAND (SP)	0.38	25.01	1

NOTES: ***1.*** *Soil type is as per Table 5.2 of AS1547-2012*

2. *Test method described in GDR3.7.*

3. *Test results likely to have been influenced by shallow groundwater*

7.3. Soil Sampling

Soil samples for the ASS study were collected from selected boreholes in accordance with the following guidelines:

- Department of Environmental Regulation (DER) (2015) *Identification and Investigation of Acid Sulfate Soils and Acidic Landscapes and;*
- Department of Agriculture and Water Resources (DAWR) (2018) National Acid Sulfate Soils Guidance.

Samples collected for acid sulfate soils testing were collected at 0.25 m intervals using dedicated nitrile gloves and placed in laboratory-supplied sample bags. The samples were then placed in an ice chilled cooler in the field, and then transferred to a freezer until field testing was undertaken. All samples scheduled for analysis were transported to the laboratory with sufficient packaging and ice to ensure preservation of sample integrity. The lateral borehole distribution is considered appropriate for the project and in accordance with the aforementioned regulatory guidelines.

7.4. Acid Sulfate Soil Field Testing

A small portion of each soil sample was tested for pH before (pH_F) and after (pH_{FOX}) rapid oxidation with hydrogen peroxide (H_2O_2). The samples were then placed in an ice chilled cooler until submission to the laboratory for chromium reducible sulfur (CRS) analysis.

Samples with field pH values (pH_F) of <3 to 4 indicate the presence of ASS, thus indicating acids in the soil profile have oxidised.

The presence of unoxidized acids or potential acid sulfate soil (PASS) is indicated if:

- a strong reaction with hydrogen peroxide is observed;
- the pH_{FOX} is at least 1 pH unit below pH_F; or
- the pH_{FOX} is <3 to 4 and one or both of the above conditions apply.

The texture based net acidity action criteria presented in the DER (2015) *Identification and Investigation of Acid Sulfate Soils and Acidic Landscapes* guideline document specifies a value of 0.03 %S based on the anticipated volume of soil to be disturbed being greater than 1,000 tonnes. This value has been adopted for the assessment of net acidity in soils across the site.

7.5. Groundwater Monitoring Wells

Groundwater monitoring wells were installed in boreholes drilled Geoprobe 6620 DT drill rig supplied and operated by Direct Push Probing.

Wells were constructed using 50 mm, class 18 flush-threaded PVC with a 2.5 m screened interval was installed at the base of each well and finished with approximate 0.6 to 0.7 m solid section extending to the surface. Refer to Appendix C for more information on construction details for each well.

A submersible pump was used to remove fine sediments and filter sand from the well. Groundwater levels were measured more than 7 days after installation and development to allow the water in the well to reach hydrostatic levels (refer Attached Table 3).

7.6. Groundwater Sampling

The groundwater wells were sampled in accordance with the following Australian Standards:

- AS/NZS 5667.1:1998 Water Quality Sampling. Part I – Guidance on the Design of Sampling Programs, Sampling Techniques and the Preservation and Handling of Samples; and
- AS/NZS 5667.11:1998 Water Quality Sampling. Part II – Guidance on the Sampling of Groundwater. Groundwater samples were recovered using low-flow methods.

The pump was set at the centre of the screened interval and drawdown measured concurrently whilst pumping to ensure the pump flow rates were less than the recharge capacity of the well. An initial flow rate in the order of 0.5-1.0 L/min was used and adjusted as appropriate to ensure minimal drawdown (<0.1m) during purging. New nitrile disposable gloves were used at each monitoring well location.

Representative samples for laboratory analysis were collected after stabilisation of groundwater physio-chemical parameters was achieved. Measurements of these parameters including temperature, pH, electrical conductivity, redox potential and dissolved oxygen, were taken every 60 seconds using appropriately calibrated equipment.

Stabilisation of groundwater parameters is considered to be achieved when there is less than 10% variation in physiochemical parameters between three successive readings. The groundwater physio-chemical parameters were recorded which included physical observations such as colour and turbidity of the purged water, any indications of the presence of contamination, including odour, sheen, the presence of any foreign material or objects, any quality assurance/quality control (QA/QC) sampling and the unique sample identifier.

Groundwater samples were collected directly from the low-flow pump into appropriately preserved and labelled, laboratory supplied bottles and filled to zero headspace. Samples that required field filtering were collected using an in-line, single-use, 0.45 µm filter.

All samples were stored in an ice chilled cooler during fieldwork and submitted to the laboratory at the conclusion of the field work, with adequate packing to ensure that they arrived intact and at the appropriate temperature to ensure sample preservation.

8. LABORATORY TESTING

8.1. Geotechnical

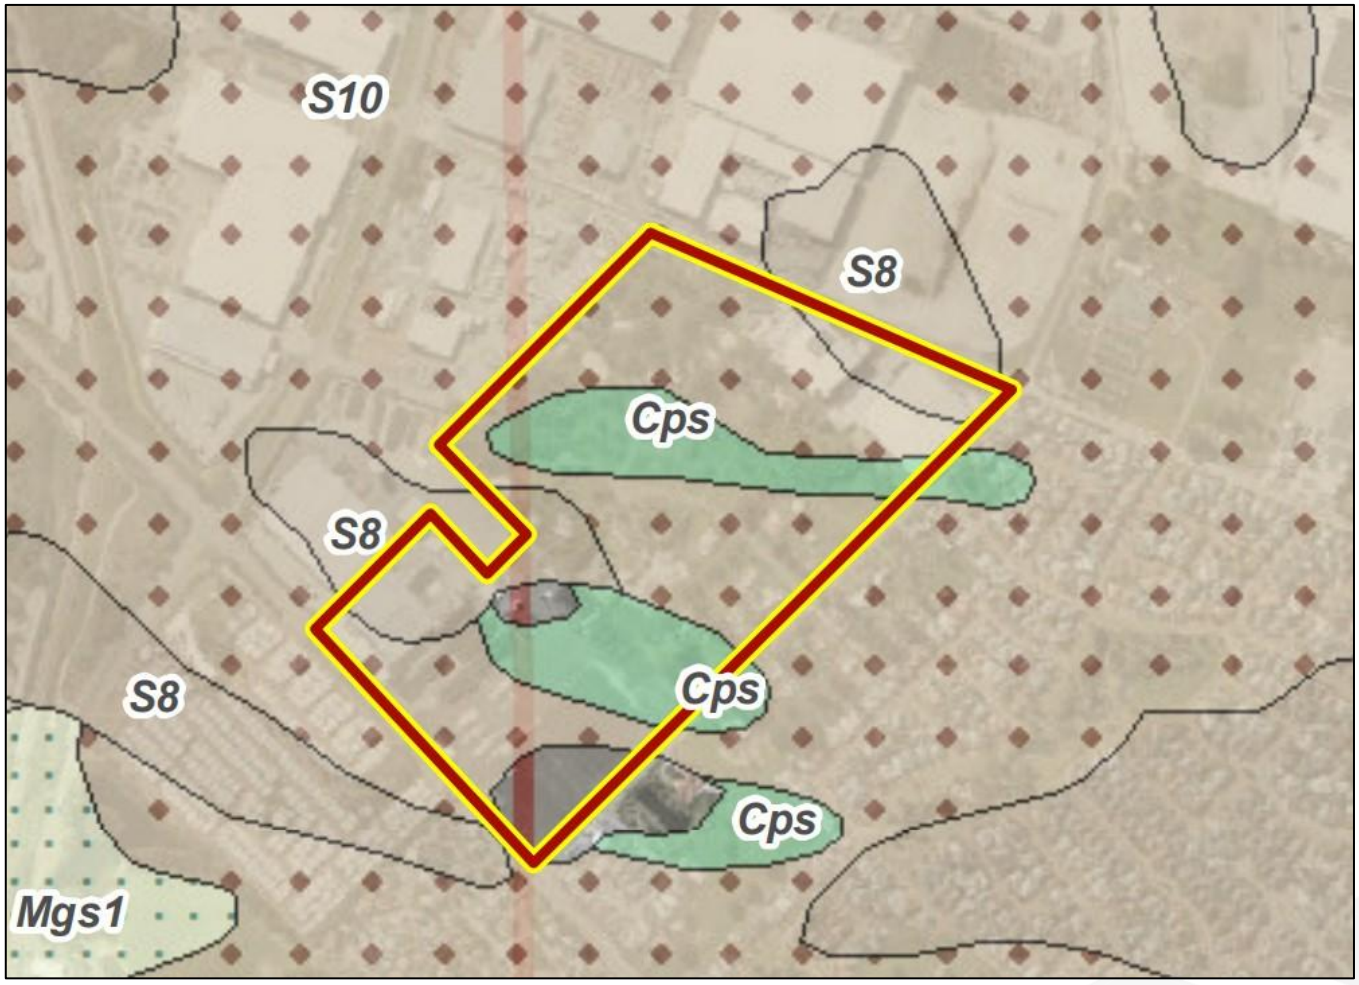
Geotechnical and chemical laboratory testing of soil samples was undertaken by Western Geotechnical and Laboratory Services (WGLS) and Envirolab Services (WA) at their NATA accredited laboratory. Laboratory test results along with the test methods followed are presented in Appendix E and summarised in Attached Tables 1 and 2.

Chemical test results from previous studies are also included in Attached Table 2.

8.2. Environmental

Environmental laboratory testing was conducted by Eurofins laboratory using the chromium reducible sulfur (CRS) method which provides acid base accounting and quantification of potential acid generation. The selection of samples for laboratory analysis was based on soil type and the results of field testing. Groundwater samples were also analysed by Eurofins laboratory for the Department of Water – Groundwater Quality Suite. All laboratory analysis was undertaken using NATA-accredited methods of analysis.

Laboratory certificate of analysis are presented in Appendix F.



9. SITE CONDITIONS

9.1. Geology

Table 6: Summary of Geology Mapping

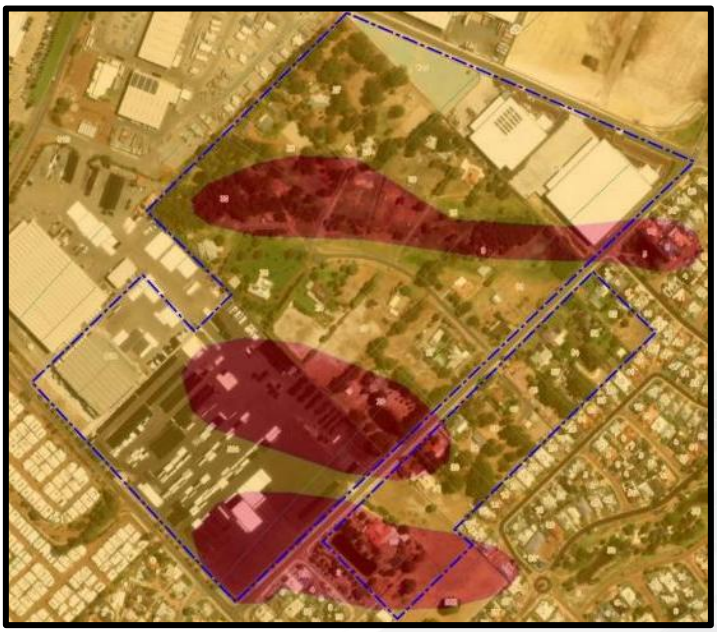
Map Sheet	Map Scale	Mapped Soils
Perth	1:50,000	Refer In-Line Image 3 for distribution of following units: **- Cps**: Peaty CLAY: "*dark grey and black with variable sand content of lacustrine origin [Swamp Deposits (Qhw)]*" **- S8**: Bassendean SAND: "*very light grey at surface, yellow at depth, fine to medium-grained, sub-rounded quartz, moderately well sorted of eolian origin*" **- S10**: "*Thin Bassendean Sand over Guildford formation*"

***NOTE**: Encountered subsurface profile discussed in Section 9.4.*

In-line Image 3: Excerpt from Perth 1:50,000 scale environmental geology map. HCLIA marked in red/yellow.

9.2. Groundwater

Table 7: Summary of Groundwater Levels



Item	Date	Depth Range (m)	Elevation Range (m AHD)	Comment
Perth Groundwater Atlas	2004	-	North: 13 South: 15	Inferred from levels measured in monitoring wells near the end of summer in 2004 only.
	2019		North west: 15.0 to 17.0 South east: 18.5 to 19.5	Inferred from maximum and minimum levels measured in monitoring wells in 2019 only.
DBCA Mapping	-	-	-	Most of the site are mapped as "Sumpland/Dampland", defined as a seasonally inundated/waterlogged area.
Site observations	Aug/Sept 2025	-	Surface to > 3 (Refer Attached Tables 3 to 7)	Groundwater also observed in lakes in southern part of site, and along drainage line in northern part of site. Groundwater could perch on underlying clay / clayey soils at the site.
Recommended Design	-	-	-	Design groundwater levels for the site must be assessed by a suitably qualified civil engineer and / or hydrologist. Subsoil drains and / or table drains could possibly be required.

NOTES: ***1.*** *Perth Groundwater Atlas observations based on monitoring wells which are not located at the site.*

2. *Elevation range for site observations is based on depth and site levels during fieldwork*

9.3. Acid Sulfate Soils

According to the DWER online ASS risk database, the HCLIA and SCP sites are is generally mapped as being within an area of 'moderate to low' ASS risk (highlighted in yellow in In-line Image 4 below) , with part of the site identified as having 'high to moderate' risk (highlighted in red in In-line Image 4 below) within the upper 3 m of the soil profile. High risk areas are judged to be associated with potential organic soils mapped in these areas (refer Section 9.1).

In-line Image 4: ASS Risk Mapping (DWER Database)

9.4. Contamination

The DWER contaminated sites database indicates that the site is not registered as a contaminated site. We note that the public database only shows sites classified as 'Remediated for restricted use', 'Contaminated – restricted use', 'Contaminated – remediation required'.

We understand that the site is likely to be redeveloped for commercial/light industrial purposes and as such, the site is unlikely to be changing to a more sensitive land use.

During fieldwork there were no visual or olfactory indicators of potential contamination. We note that some uncontrolled fill is present in the northern corner of the site. This may require investigation if anthropogenic waste is encountered within the material and/or it is proposed to be reused onsite.

10. GROUND MODEL

The encountered subsurface conditions are summarised in Attached Tables 3 to 7, ad can be generalised as follows:

Most of HCLIA and SCP Sites:

- Surficial Topsoil / Hardstand / Sand Fill Layers; over
- **SAND (SP / SP-SM)**: fine to medium grained, sub angular to sub rounded, typically grey, typically trace fines, typically loose to depths of about 0.5 m to 2.5 m and then becomes typically medium dense, extending to depths of 2.0m to over 6.2 m; with
  - **Interbedded layers of cemented sand / 'Coffee Rock'**: encountered at some locations as cemented layer of sand typically with a higher fines content (i.e. Silty SAND in some zones) about 0.3 m to 1.0 m thick (where penetrated) and below about 2.0 m to 3.4 m depth (refer Attached Tables 3 to 7 for locations encountered). Coffee rock inferred from CPT refusal at some locations. Associated uncemented zones of discoloured brown / black sand with a higher fines content were also encountered in some locations. Layer underlain by sand; over
- **Guildford Formation interbedded CLAY / Clayey SAND / Sandy CLAY / SAND Layers (SP/SC/CL-CH)**: typically stiff to hard cohesive layers and medium dense sand layers, locations of encountered Guildford Formation summarised in Attached Tables 3 to 7.

HCLIA - within / adjacent drainage line and wetland area[1]:

Variable organic soils were encountered as follows:

- **CPT01**: Possible inferred organic soil layer from 0.9 m to 1.2 m depth;
- **BH02**: Trace organics in Clayey SAND from 0.9 m to 2.0 m depth;
- **BH04**: Organic Clayey SAND from 0.7 m to 1.4 m depth
- **BH12/MW01**: PEAT from 0.0 m to 0.6 m depth, and then Organic SAND from 0.6 m to 1.4 m depth.

Notes:

- [1] Drainage line traverses from west to east in northern part of site (refer Figure 1). Wetland area present in western corner of site near Lewis Road. Similar zones of organic soils could be present in lakes at the site (Refer Table 1).
- [2] An area of surficial uncontrolled fill about 1.1 m thick was encountered in the northern corner of site at 27 Hatch Court (refer Galt report referenced: WAG250256-01 001 R Rev1);

11. GEOTECHNICAL ASSESSMENT

The HCLIA and SCP sites are considered geotechnically suitable for redevelopment as industrial land, provided appropriate site preparation is done. Standard site preparation measures for sand sites will apply for most of the site. Geotechnical challenges relevant to the proposed development are summarised as follows:

- **Peat / organic soils** were encountered within / adjacent the drainage line in the northern part of the HCLIA site, and within the wetland area near Lewis Road (refer Figure 1). Similar zones of organic soils could be present in lakes at the site (refer Figure 1 – could also extend to lake in south of SCP). If these areas are to be developed, organic soils will need to be removed from the site. We note that organic soils are likely to be acid sulfate generating, and therefore would require treatments (refer Section 12). Dewatering is also likely to be required to enable remediation of these areas;
- **Cemented sand / 'Coffee Rock'** layers (about 0.3 m to 1.0 m thick) interbedded within the sand were encountered below about 2.0 m to 3.4 m depth (refer Attached Tables 3 to 7). Associated uncemented zones of discoloured brown / black sand with a higher fines content were also encountered in some locations. These materials could have a low permeability, which could impact the performance of soakwells. Coffee rock also has the potential to be acid generating (if removed) and would require treatment (refer Section 12);
- **Areas of shallow groundwater** have been identified in lower lying areas (refer Table 7 and Attached Table 3). Shallow groundwater will impact temporary excavations, and compaction during construction. Dewatering is likely to be required, particularly if construction is undertaken during winter. The potential requirement for and ASSDMP is discussed in Section 12. Shallow groundwater will affect the performance of soakwells and effluent disposal. Control of groundwater levels at the site must be assessed by a suitably qualified civil engineer / hydrogeologist. Subsoil drainage could possibly be required;
- **Surficial uncontrolled fill** about 1.1 m thick was encountered in the northern corner of site at 27 Hatch Court (refer Galt report referenced: WAG250256-01 001 R Rev1). Uncontrolled fill must be removed, assessed by a suitably qualified engineer and environmental scientist (refer Section 12), and either removed from site, or (if suitable) reused as approved fill; and
- **Environmental considerations** are discussed in Section 12.

Geotechnical recommendations for the site are summarised in the Table 8.

Table 8: Summary of Geotechnical Assessment

Type	Clause	Parameter	Comment
Site Suitability	-	-	We consider both sites to be geotechnically suitable for the proposed development with appropriate site preparation measures. Standard site preparation measures will apply for most of the site (refer further comments above table).
Site Classification (AS2870)	GDR5	A / P	Class A for most of each site. Class P in drainage lines, wetland areas and lakes (refer Table 1). The site classification in these areas could be improved if organics soils are removed and replaced.
Site Subsoil Class (AS1170.4)	-	Ce	-
Site Preparation	GDR6	-	**For most of the site**: preparation will comprise **GDR6.2.1 Common Measures** followed by **GDR6.2.2 Sand Sites.** Surficial uncontrolled fill in the northern part of the site must be remediated (refer Galt report referenced: WAG250256-01 001 R Rev1). We anticipate raising of the site above shallow groundwater levels by importation and compaction of sand fill (**Permeable Sand**), however this is subject to civil design. **In drainage lines, wetland areas and lakes (refer Table 1):** If these areas are to be developed, organic soils present in these areas (refer Section 9.4) will need to be removed and replaced with approved fill. Dewatering and treatment of water / soil for acid sulfates will also be required (refer Section 12).

Type	Clause	Parameter	Comment
Footing Preparation and Testing	GDR6.4	-	We expect the base of footings at this site to be entirely within sand. We refer you to GDR6.4.1. A PSP may be used to verify compaction in footing excavations as discussed below.
Topsoil Strip	GDR6.2.1	Thickness = 100 mm	Expected thickness of topsoil strip (average).
Compaction Control	GDR7	-	Requirements for "Sand" as per GDR7 Compaction control at this site may be done using a Perth sand penetrometer (PSP). The target blow counts for "Bassendean Sand" are applicable as per **GDR7.4 Perth Sand Penetrometer.**
Approved Fill	GDR8	Permeable Sand or General Sand	Approved fill at this site is to comprise **Permeable Sand** (where stormwater disposal is required) or **General Sand** (where stormwater disposal is not required) as per **GDR8 Approved Fill and Conformance Testing.** The insitu sand is suitable for reuse as **General Sand**, and as likely to have an unsaturated hydraulic conductivity of approximately 3 m/day when compacted. **Further permeability testing of recompacted insitu sand is required to derive a design hydraulic conductivity value.**
Excavations, batters and slopes	GDR12	1V:2H (temporary) 1V:3H (permanent)	Excavations in sand should be readily achievable to 2 m with 15 ton excavator or similar. The batter angles given are for slopes up to 2 m high and above groundwater. Refer to **GDR12 Excavations, Batters and Slopes** for more information. **Dewatering will be required for excavations in lower lying areas of shallow groundwater.**
Unsaturated Hydraulic Conductivity	GDR13	k_{unsat} = 3 m/day for isolated soakwells, and k_{unsat} = 5 m/day for interconnected soakwells.	k_{unsat} values apply where disposing into natural grey sand, minimum 0.5 m above the groundwater table, coffee rock layers (or overlying perched water) or black / brown sand layers near the groundwater table as per GDR13.4.
Pavement Subgrades	GDR16	CBR = 10%	For subgrades of granular pavements comprising compacted approved fill / insitu sand.
Acid Sulfate Soils	-	Refer Section 12	Management of acid sulfate soils is likely to be required during construction.

NOTES: ***1.*** *q_{all} – allowable bearing pressure (maximum for all footings, refer to footing tables for further details)*

12. PRELIMINARY ENVIRONMENTAL ASSESSMENT

12.1. Soil

The field-testing results are summarised in Table 9 below and presented in Appendix G. Laboratory certificates of analysis are presented in Appendix H

Table 9: Summary of Soil Field Results

Field pHf range	Field pHfox range	pH change	Laboratory pH range	Maximum Net Acidity (%S)
4.7 – 8.5	2.6 – 6.5	1.0 – 5.8	4.0 – 9.5	<0.02 – 0.14

Laboratory analytical results indicate that the net acidity in all samples, except BH16/3.0 (0.14%S) were below the laboratory limit of reporting (LOR) and/or below the maximum net acidity of 0.03%S.

Tabulated results are presented in Appendix G.

12.2. Groundwater

Groundwater at the site was encountered at depths ranging from 0.28 to 1.15 m below ground level with a pH ranging from 6.18 – 7.16. Mildly elevated inherent acidity along with high to very high alkalinity concentrations were noted at

both monitoring locations indicating that groundwater will likely have sufficient self-buffering capacity to maintain an acceptable pH in the event of ASS generation.

Elevated concentrations of aluminium and iron indicate that historical oxidation of ASS may have occurred at the site. Concentrations of chloride were found to exceed non-potable use of groundwater guidelines in MW01 (330 mg/L).

Groundwater field parameters are presented in Appendix H and tabulated groundwater results are presented in Appendix I.

12.3. Summary

Based on the findings of the study and previous experience with ASS identification, coffee rock and organic soils at the site are considered to be ASS.

13. RECOMMENDATIONS

We recommend a more detailed investigation of ASS is conducted in the event that deep disturbances and/or dewatering are required as part of future development at the site. The need for this will mainly depend on the filling regime and disturbances in the drainage lines and lakes present at the site.

14. CLOSURE

NOTES:

1. *'BGL' – below current ground level*

2. *CPT probe hole collapsed before groundwater could be measured.*

3. *CPT probes may not have had sufficient time to recharge to hydrostatic levels.*

4. *Coffee rock layer, typically about 0.3 m to 1.0 m thick, and underlain by sand. Coffee rock inferred from CPT refusal at some locations.*

5. *Investigation typically encountered thin surficial fill / topsoil sand over clay / clayey or cemented soil layers as stated in table above. Thicker surficial organic layers encountered near / within drainage line in northern part of site as summarised above. Refer to appendices for further details.*

Attached Table 4: Summary of encountered conditions at 27 Hatch Court (May 2025)

DEFINITIONS

q_t : Cone tip resistance corrected for pore water pressure
S_t : Sensitivity
e : Void ratio
D_r : Relative density
OCR : Overconsolidation ratio
OC : Overconsolidated

SOIL BEHAVIOUR TYPE ZONES

1. Sensitive fine grained
2. Organic material
3. Clay
4. Silty clay to clay
5. Clayey silt to silty clay
6. Sandy silt to clayey silt
7. Silty sand to sandy silt
8. Sand to silty sand
9. Sand
10. Gravelly sand to sand
11. Very stiff fine grained material (OC/cemented)
12. Sand to clayey sand (OC/cemented)

NOTES

A. Some overlap in type zones is expected
B. Local correlations are preferred and may indicate soil type boundaries that are different from those shown above

Appendix C: Borehole Logs

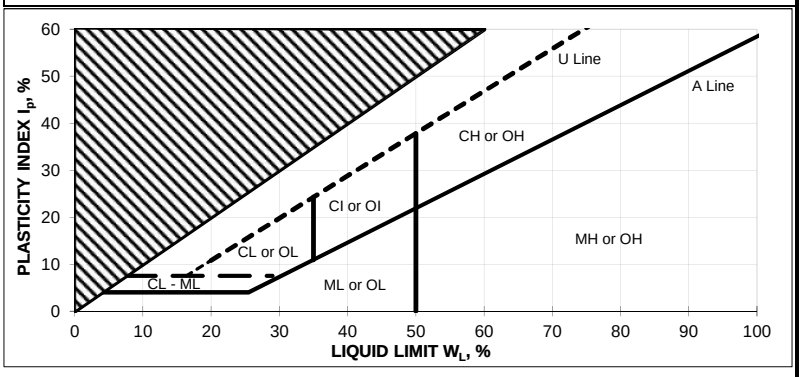
METHOD OF SOIL DESCRIPTION
BOREHOLE AND TEST PIT REPORTS

GRAPHIC LOG & SOIL CLASSIFICATION SYMBOLS

Graphic	USCS	Soil Name
		FILL (various types)
		COBBLES / BOULDERS
	GP	GRAVEL (poorly graded)
	GW	GRAVEL (well graded)
	GC	Clayey GRAVEL
	GM	Silty GRAVEL
	SP	SAND (poorly graded)
	SW	SAND (well graded)
	SC	Clayey SAND

Graphic	USCS	Soil Name
	SM	Silty SAND
	ML	SILT (low liquid limit)
	MH	SILT (high liquid limit)
	CL	CLAY (low plasticity)
	CI	CLAY (medium plasticity)
	CH	CLAY (high plasticity)
	OL	Organic SILT (low liquid limit)
	OH	Organic SILT (high liquid limit)
	Pt	PEAT

NOTE: Dual classification given for soils with a fines content between 5% and 12%.



SOIL CLASSIFICATION AND INFERRED STRATIGRAPHY

Soil descriptions are based on AS1726-2017. Material properties are assessed in the field by visual/tactile methods in combination with field and laboratory testing techniques (where used).

NOTE: AS 1726-2017 defines a fine grained soil where the total dry mass of fine fractions (<0.075 mm particle size) exceeds 35%.

PARTICLE SIZE		
Soil Name		**Particle Size (mm)**
BOULDERS		>200
COBBLES		63 to 200
GRAVEL	Coarse	19 to 63
	Medium	6.7 to 19
	Fine	2.3 to 6.7
SAND	Coarse	0.6 to 2.36
	Medium	0.21 to 0.6
	Fine	0.075 to 0.21
FINES	SILT	0.002 to 0.075
	CLAY	<0.002

PLASTICITY - MODIFIED CASAGRANDE CHART - AS1726-2017

RESISTANCE TO EXCAVATION		
Symbol	**Term**	**Description**
VE	Very easy	All resistances are relative to the selected method of excavation
E	Easy	
F	Firm	
H	Hard	
VH	Very hard	

MOISTURE CONDITION	
Symbol	**Term**
D	Dry
M	Moist
W	Wet

CEMENTATION	
Cementation	**Description**
Weakly cemented	Soil may be easily disaggregated by hand in air or water
Moderately cemented	Effort is required to disaggregate the soil by hand in air or water

CONSISTENCY		
Symbol	**Term**	**Undrained Shear Strength (kPa)**
VS	Very Soft	0 to 12
S	Soft	12 to 25
F	Firm	25 to 50
St	Stiff	50 to 100
VSt	Very Stiff	100 to 200
H	Hard	>200

ORGANIC SOILS	
Material	**Organic Content % of dry mass**
Inorganic soil	<2%
Organic soil	2% to 25%
Peat	>25%

DENSITY		
Symbol	**Term**	**Density Index (%)**
VL	Very Loose	<15
L	Loose	15 to 35
MD	Medium Dense	35 to 65
D	Dense	65 to 85
VD	Very Dense	>85

EXPLANATORY NOTES TO BE READ WITH BOREHOLE AND TEST PIT REPORTS

METHOD OF DRILLING OR EXCAVATION

AC	Air Core	E	Excavator	PQ3	PQ3 Core Barrel
AD/T	Auger Drilling with TC-Bit	EH	Excavator with Hammer	PT	Push Tube
AD/V	Auger Drilling with V-Bit	HA	Hand Auger	R	Ripper
AT	Air Track	HE	Hand Excavation	RR	Rock Roller
B	Bulldozer Blade	HQ3	HQ3 Core Barrel	SON	Sonic Rig
BH	Backhoe Bucket	N	Natural Exposure	SPT	Driven SPT
CT	Cable Tool	NMLC	NMLC Core Barrel	WB	Washbore
DT	Diatube	PP	Push Probe	X	Existing Excavation

SUPPORT

T	Timbering

PENETRATION EFFORT (RELATIVE TO THE EQUIPMENT USED)

VE	Very Easy	E	Easy	F	Firm
H	Hard	VH	Very Hard		

WATER

►	Water Inflow	▼	Water Level
◄	Water Loss (complete)		
◁	Water Loss (partial)		

SAMPLING AND TESTING

B	Bulk Disturbed Sample	P	Piston Sample
BLK	Block Sample	PBT	Plate Bearing Test
C	Core Sample	U	Undisturbed Push-in Sample
CBR	CBR Mould Sample		U50: 50 mm diameter
D	Small Disturbed Sample	SPT	Standard Penetration Test
ES	Environmental Soil Sample		Example: 3, 4, 5 N=9
EW	Environmental Water Sample		3,4,5: Blows per 150 mm
G	Gas Sample		N=9: Blows per 300 mm after
HP	Hand Penetrometer		150 mm seating interval
LB	Large Bulk Disturbed Sample	VS	Vane Shear; P = Peak
M	Mazier Type Sample		R = Remoulded (kPa)
MC	Moisture Content Sample	W	Water Sample

ROCK CORE RECOVERY

TCR = Total Core Recovery (%) $= \frac{CRL}{TCL} \times 100$

RQD = Rock Quality Designation (%) $= \frac{ALC>100}{TCL} \times 100$

TCL	Length of Core Run
CRL	Length of Core Recovered
ALC>100	Total Length of Axial Lengths of Core Greater than 100 mm Long

Phosphorus Retention Index	-		21	200	4.0	0.50	1.5

Method Summary

Method ID	Methodology Summary
AGRI-003_PRI	Phosphorous Retention index (PRI) is the ratio of adsorbed phosphorus to the equilibrium concentration. Phosphorus is extracted using KCl and determined colourimetrically. Result value is used to calculate PRI as per Allen and Jefferey.
INORG-001	pH - Measured using pH meter and electrode. Please note that the results for water analyses are indicative only, as analysis can be completed outside of the recommended holding times. Solids are reported from a 1:5 water extract unless otherwise specified. Alternatively, pH is determined in a 1:5 extract using 0.01M calcium chloride or a solid is extracted at a ratio of 1:2.5 (AS1289.4.3.1), pH is measured in the extract.
INORG-002	Conductivity and Salinity - measured using a conductivity cell at 25°C. Soil results reported from a 1:5 Soil:Water extract unless otherwise specified. Please note Resistivity is estimated by calculation and may not correlate with results otherwise obtained using the Resistivity current method (based on AS 1289.4.4.1), depending on the nature of the soil being analysed. Blanks may yield EC readings >1µS/cm, this is likely due to adsorption of Carbon Dioxide while the blank sample is sat on the instrument autosampler prior to analysis. The values are generally insignificant (<5µS/cm) compared to most actual sample conductivities.

Result Definitions

Identifier	Description
NR	Not reported
NEPM	National Environment Protection Measure
NS	Not specified
LCS	Laboratory Control Sample
RPD	Relative Percent Difference
>	Greater than
<	Less than
PQL	Practical Quantitation Limit
INS	Insufficient sample for this test
NA	Test not required
NT	Not tested
DOL	Samples rejected due to particulate overload (air filters only)
RFD	Samples rejected due to filter damage (air filters only)
RUD	Samples rejected due to uneven deposition (air filters only)
##	Indicates a laboratory acceptance criteria outlier, for further details, see Result Comments and/or QC Comments

Quality Control Definitions

Blank

This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, and is determined by processing solvents and reagents in exactly the same manner as for samples.

Surrogate Spike

Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

LCS (Laboratory Control Sample)

This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.

Matrix Spike

A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.

Duplicate

This is the complete duplicate analysis of a sample from the process batch. The sample selected should be one where the analyte concentration is easily measurable.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria. Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction. Spikes for Physical and Aggregate Tests are not applicable. For VOCs in water samples, three vials are required for duplicate or spike analysis.

General Acceptance Criteria (GAC) - Analyte specific criteria applies for some analytes and is reflected in QC recovery tables.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% - see ELN-P05 QAQC tables for details (available on request); <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase. Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was typically insufficient in order to satisfy laboratory QA/QC protocols.

Miscellaneous Information

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached. We have taken the sampling date as being the date received at the laboratory.

Two significant figures are reported for the majority of tests and with a high degree of confidence, for results <10*PQL, the second significant figure may be in doubt i.e. has a relatively high degree of uncertainty and is provided for information only.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, Total Recoverable metals and PFAS where sediment/solids are included by default.

Urine Analysis - The BEI values listed are taken from the 2022 edition of *TLVs and BEIs Threshold Limits by ACGIH*.

Air volumes are typically provided by customers (often as flow rate(s) and sampling time(s) and/or simply volume(s) sampled or exposure times (determines 'volume' passive badges are exposed to)). Hence in such circumstances the volume measurement is inevitably not covered by Envirolab's NATA accreditation. An exception may occur where Envirolab Newcastle does the sampling where accreditation exists for certain types of sampling and hence volume determination(s). Note air volumes are often used to determine concentrations for dust and/or analyses on filters, sorbents and in impingers. For canister sampling, the air volume is covered by Envirolab's NATA accreditation.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from the latest "Australian Drinking Water Guidelines", published by NHMRC. No guideline values have been set for Total Coliforms in drinking water. Increased concentrations should be investigated. Total Coliforms are not considered useful as indicators of the presence of faecal contamination.

Where we have provided guideline values eg. ADWG Health Value, it is the responsiblity of the reader to decide if the water is fit for consumption. Please note that the tests we have conducted are just a selection of common tests to give you a general idea of drinking water quality. There are many other tests included in the ADWG that we have not tested for.

Data Quality Assessment Summary PGI0989

Client Details

Client	Western Geotechnical & Laboratory Services
Your Reference	S18630 / Proposed HCLIA
Date Issued	19/09/2025

Recommended Holding Time Compliance

No recommended holding time exceedances

Quality Control and QC Frequency

QC Type	Compliant	Details
Blank	Yes	No Outliers
LCS	Yes	No Outliers
Duplicates	Yes	No Outliers
Matrix Spike	Yes	No Outliers
Surrogates / Extracted Internal Standards	Yes	No Outliers
QC Frequency	Yes	No Outliers

Surrogates/Extracted Internal Standards, Duplicates and/or Matrix Spikes are not always relevant/applicable to certain analyses and matrices. Therefore, said QC measures are deemed compliant in these situations by default. See Laboratory Acceptance Criteria for more information

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Extraneous Material	Brisbane	Sep 10, 2025	6 Week

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	N/A
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
S01	Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime (CaCO3) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m3 in-situ soil' multiply 'reported results' x 'wet bulk density of soil in t/m3'
S02	Retained Acidity is Reported when the pHKCl is less than pH 4.5
S03	Acid Neutralising Capacity is only required if the pHKCl if greater than or equal to pH 6.5
S04	Acid Sulfate Soil Samples have a 24 hour holding time unless frozen or dried within that period

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Standard Geotechnical Definitions, Recommendations, Requirements and Limitations

GDR1 ABOUT THIS APPENDIX

These technical notes are to be read with the attached report. These notes contain important information regarding the study in the attached report, and the report cannot be considered in isolation without full reading of these notes.

Where there are conflicts between this appendix and the report text, the report text takes precedence.

Unless noted otherwise, geotechnical investigations are conducted in accordance with AS1726-2017, “Geotechnical site investigations”.

Unless noted otherwise, the report does not include any assessment (or implied assessment) of karst risk.

GDR2 DEFINITIONS

The following definitions apply:

- **Approved Fill** – fill that has been assessed and approved by the geotechnical engineer or civil designer for a particular purpose.
- **Bedding** – A controlled fill layer placed beneath buried elements such as pipes, cables or other infrastructure to provide uniform support and distribute loading.
- **Bulk Fill** – Controlled fill intended to support future infrastructure, but potentially lacking some engineering properties required for upper fill layers or adjacent to structures, where fill with specific properties may be required. Contrast with Select Fill.
- **Civil Design** – the engineering design of the earthworks including surface water and erosion control and subsurface drainage control (where required) to achieve an earthworked, drained site which is capable of supporting the proposed development (including target site classification to AS2870, where relevant). This design is separate to this geotechnical investigation and is a required element of a site development.
- **Clay** – A component of a soil with particles smaller than 0.002 mm in size.
- **Cohesionless (Non-cohesive) Soil** – A soil mass that has does not hold together at low applied stress levels. The strength of the soil depends solely on friction between particles.
- **Cohesive Soil** – A soil mass that has holds together and can adhere to itself.
- **Collapsible Soil** – a soil with high void ratio that is typically strong when dry but loses strength and consolidates under constant stress when wetted, usually due to loss of soil matric suction or dissolving of a chemical cementing agent.
- **Compaction –** The process of increasing the soil density, typically be mechanical means.
- **Competent Person** – A person who has, through a combination of training, education and experience, acquired knowledge and skills enabling that person to correctly perform a specified task.
- **Consistency** – The stiffness of a cohesive soil, at specific moisture contents, to resist mechanical stress or manipulation (remoulding).
- **Controlled (or engineered) Fill** – Any fill for which engineering properties are controlled during placement. Also referred to as structural fill.
- **Dense –** with respect to sandy soils, at a relatively high density index or dry density ratio, exhibiting better engineering parameters with respect to strength and stiffness than the same material at a lower density index.
- **Density** – A measure of the mass of material per unit volume.
- **Eccentric Load** – a load incorporating either a varying vertical load and/or a horizontal load such that the peak vertical stress exceeds the average vertical stress.
- **Embedment Fill** – A controlled fill material placed around and above buried infrastructure (such as pipes, cables or conduits) to provide protection and support.
- **Fill** – Any material that has been placed by anthropogenic processes.
- **Fines** – A component of a soil with particles smaller than 0.075 mm in size.
- **Groundwater** – Water located beneath the earth’s surface in pore spaces, fractures and voids in soil or rock.

- **Gravel** – A component of a soil with particles between 2.36 mm and 63 mm in size.
- **Heavily Loaded** – in reference to mobile plant, particularly intended for equipment where ground bearing pressures exceed 50 kPa and/or equipment has a high centre of gravity and could be prone to toppling. In reference to buildings/structures, where footing pressures exceed 100 kPa and/or footing dimensions exceed 1 m wide.
- **Hydraulic Conductivity** – ratio of volume flux to hydraulic gradient – a quantitative measure of soil's ability to transmit water when subjected to a hydraulic gradient. k_{sat} – saturated hydraulic conductivity, intended for dewatering assessment, subsoil drainage design and other engineering assessments where saturated soils are relevant. k_{unsat} – unsaturated hydraulic conductivity, intended for design of stormwater disposal elements such as soakwells and infiltration basins, where the base of disposal elements is above the groundwater level.
- **In situ** – In the place and condition in which it exists naturally. May also refer to fill that is present at any site prior to an investigation taking place.
- **Limestone** – A sedimentary carbonate rock. The use of the term does not infer a specific strength, carbonate content or grain size. Refer to GDR4.1 for further detail.
- **Loose** – with respect to sand soils, at a relatively low density index or dry density ratio, typically indicating poorer engineering parameters with respect to strength and stiffness than the same material at a higher density index.
- **Material** – Matter that meets the definitions of 'soil', 'rock', other engineered matter (i.e., concrete, bricks etc.) or non-engineered matter (organics, contaminated refuse, deleterious material).
- **May** – Indicates that the statement is an option.
- **Must** – Indicates that the statement is mandatory.
- **Natural** – In the context of soil or rock, material which is present as a result of natural geological processes and has not been subject to anthropogenic engineering processes (such as filling, excavation, replacement, etc).
- **Organic** – In the context of soil, material derived from living matter, primarily plants.
- **Overconsolidated** – a soil that has been subjected to a greater vertical stress than its current state.
- **Permeable Soil** – soil that meets the civil design permeability requirements to allow relatively rapid flow of water through the soil matrix.
- **Rock** – Any aggregate of minerals and/or materials that cannot be disaggregated by hand in air or water without prior soaking.
- **Sand** – a component of soil with particle size between 0.075 mm and 2.36 mm.
- **Select Fill** – a controlled fill which has been chosen for particular engineering characteristics (such as strength, CBR, grading, permeability, etc), commonly for use as a higher-grade capping layer or adjacent to structures. Contrast with Bulk Fill.
- **Shall** – Indicates that the statement is mandatory.
- **Should** – Indicates that the statement is a recommendation.
- **Silt** – A component of a soil with particles between 0.075 mm and 0.002 mm in size.
- **Soil** – Particulate materials that occur in the ground and can be disaggregated or remoulded by hand in air or water without prior soaking.
- **Sand** – A component of a soil with particle between 0.075 mm and 2.36 mm in size.
- **Uncontrolled Fill** – Any material that has been deposited by anthropogenic process, which does not meet the definition of 'controlled fill'.

GDR3 GEOTECHNICAL TEST METHODS AND INTERPRETATION

GDR3.1 Test Pit Excavation

Test pit excavations are formed using mechanical excavation equipment (typically an excavator) or hand dug, with the objective of inspecting (or profiling) the soil exposed in the excavation.

Typical limitations on test pit excavations are:

- Limited depth of excavation – typically governed by reach of the excavator arm.
- Cannot be excavated below groundwater in cohesionless soils, due to collapse and water ingress.
- Cannot be excavated through very stiff / very dense soils (i.e., desiccated clays or cemented soils) or most rock.
- Cannot typically obtain rock samples that are suitable for strength testing.

Test pits are usually mechanically excavated with a toothed bucket (intended for excavation in clay or weak rock) or a flat-edged bucket (typically for sands).

When hand-dug test pits are excavated, it is usually for recovery of near-surface soils or inspection of shallow in-ground elements.

We note that where test pits are excavated on a site, they are only ever loosely backfilled during our studies. They must always be located during site preparation works, over-excavated to their full depth and plan extents and re-filled with approved fill in compacted layers.

GDR3.2 Cone Penetration Tests (CPTs)

Cone penetration testing (CPT) is done by Galt or specialist contractors and typically to AS1289.6.5.1. The test involves pushing an instrumented cone into the soil with a hydraulically operated pushing frame. The test measures tip resistance and sleeve friction on the cone, which are then plotted with depth.

We interpret soil types and associated geotechnical soil parameters from CPT data using the following:

- Galt’s in-house correlations between CPT data and other geotechnical testing.

GDR3.3 Borehole Drilling

Boreholes are drilled for sampling of the soil and rock, with a small disturbance footprint. Typical techniques are:

- Auger drilling (hand auger or machine auger) – for recovery of soil at relatively shallow depths only. Cannot penetrate cemented soils or rock.
- Push probe drilling – for recovery of soil at relatively shallow depths and below groundwater. Cannot penetrate cemented soils or rock.

- Air core drilling – for recovery of soil, cemented soil and rock (typically up to high strength rock). Not suited to drilling of very high strength rock.
- Diamond coring (or rotary coring) – for recovery of cemented soil, rock and some soil types (typically not sand). Suited to all strengths of rock.

If used, standard penetration tests (SPTs) are done in accordance with AS1289.6.3.1. Correlations for consistency and density are based on:

- Standards Australia (2016), "HB160-2006, Soils Testing".

GDR3.4 Dynamic Cone Penetrometer (DCP)

The DCP is a hand-held tool for assessing penetration resistance of a soil. This comprises a 16 mm rod equipped with a 20 mm cone, hammered into the ground using a falling 9 kg weight on a 510 mm slide hammer on the top of the rod. This is done in accordance with AS1289.6.3.2 and the blow counts to hammer in the rod are measured in 100 mm penetration increments. Where provided, correlations for consistency and density are based on:

- Standards Australia (2016), "HB160-2006, Soils Testing".

GDR3.5 Perth Sand Penetrometer (PSP)

The PSP is a variation on a DCP and uses a 9 kg weight on a 600 mm slide hammer to hammer in a 16 mm rod with a blunt (square-faced) end. Testing is done in accordance with AS1289.6.3.3, with the following typical variations:

- Testing is often done to a greater depth than the 450 mm covered in the standard.
- Blow counts are sometimes recorded in 150 mm intervals (compared to 300 mm intervals used in the standard) to provide better resolution on the tests.

Where provided, correlations for density are based on:

- Standards Australia (2016), "HB160-2006, Soils Testing".

GDR3.6 Dynamic Probing Super Heavy (DPSH)

The DPSH test involves driving a solid cone (20 cm^2) into the ground using a 63.5 kg hammer falling 760 mm. Testing is done in accordance with EN ISO 22476-2 – Geotechnical engineering – Field testing – Part 2: Dynamic probing – DPSH-B.

Results may be presented as either:

- N10 (No. of blows required for every 100 mm penetration);
- N30 (No. of blows required for every 300 mm penetration); or
- q_d (dynamic tip resistance, analogous to CPT q_c).

GDR3.7 Inverse Auger Hole Infiltration Test (Falling Head, Unsaturated Soil)

Infiltration tests are carried out using the 'inverse auger hole' method described by:

- Cocks, G (2007), "Disposal of Stormwater Runoff by Soakage in Perth Western Australia", Journal and News of the Australian Geomechanics Society, Volume 42 No. 3, pp 101-114

This test is an unsaturated falling head test, in that it is carried out above the groundwater table and is intended to mimic the behaviour of soak wells and similar drainage elements (i.e. soakage basins), which discharge stormwater into an unsaturated medium.

The hole is wetted only for a short period prior to the testing.

The test is usually repeated three times, with the intention that the second and third tests provide similar results (within about 10%-20%). Tests are done over a short duration, typically 2 minutes to 10 minutes. The focus of the testing is generally when the head is low (200 mm or lower), such that the relevant lateral zone is as saturated as the zone directly below the borehole.

The hydraulic conductivity derived from this test is not to be used for applications where saturated hydraulic conductivity is relevant, e.g.:

- Subsoil drainage design; and

- Dewatering estimations.

Based on Galt's in-house research, this method does not completely saturate the soil in any reasonable test length, and thus may not be suitable for assessment of soils at sites where the critical drainage condition is a fully saturated soil (i.e., in areas with high groundwater tables). Our research on sand sites indicates that the test does correlate well with actual soak well performance, in unsaturated sand zones without impermeable zones.

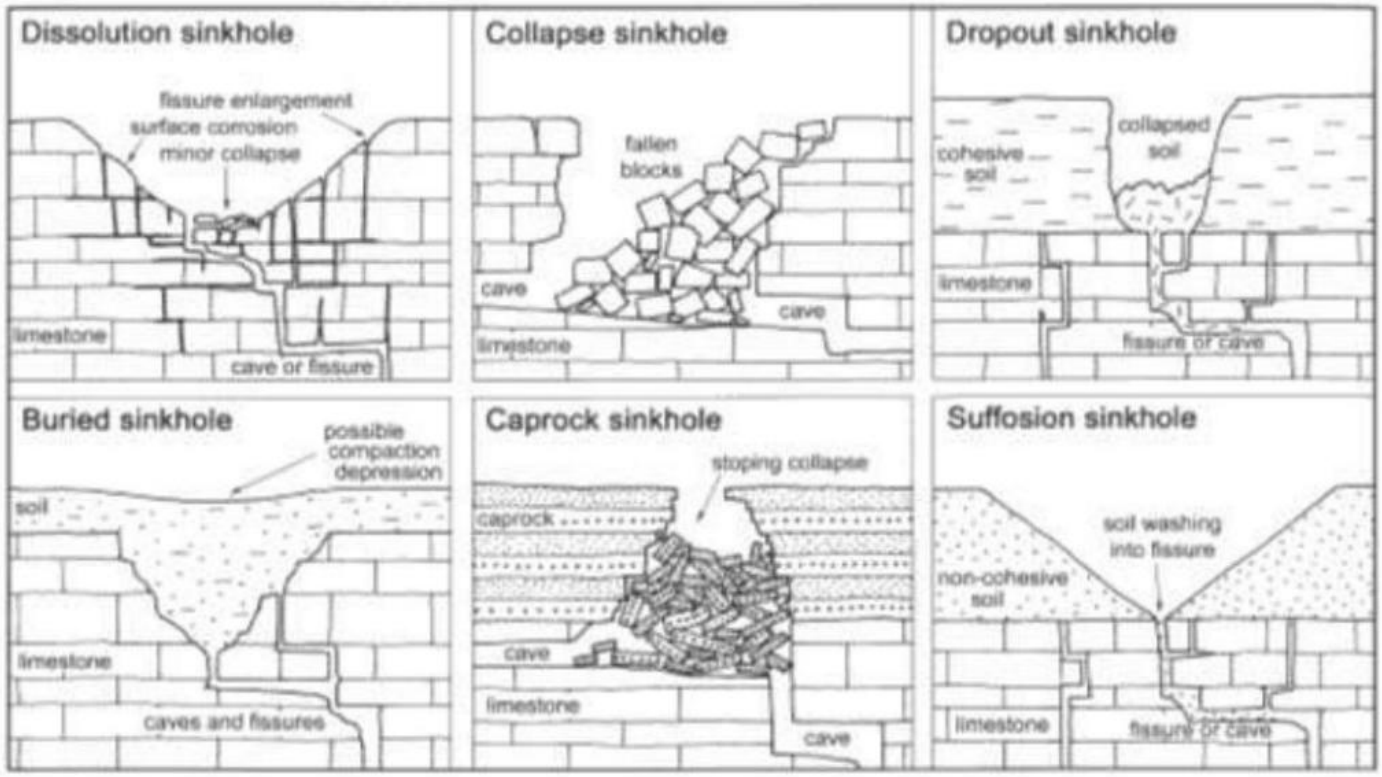
GDR3.8 Guelph Permeameter Test (Constant Head, Quasi-Saturated Soil)

The Guelph permeameter test, conducted in accordance with the constant head test method outlined in Appendix G of AS1547, is a constant-head test in nominally "saturated" soil (in that the test is conducted until a "steady state" is reached). However, we note that this test can only be done above the groundwater table and as such, is in an unsaturated zone. Therefore, the hydraulic conductivity derived from this test should be used with caution and evaluated against other test methods (such as saturated, constant-head permeability testing from laboratory samples, or in situ saturated hydraulic conductivity testing below the groundwater table).

GDR4 GEOLOGICAL UNITS

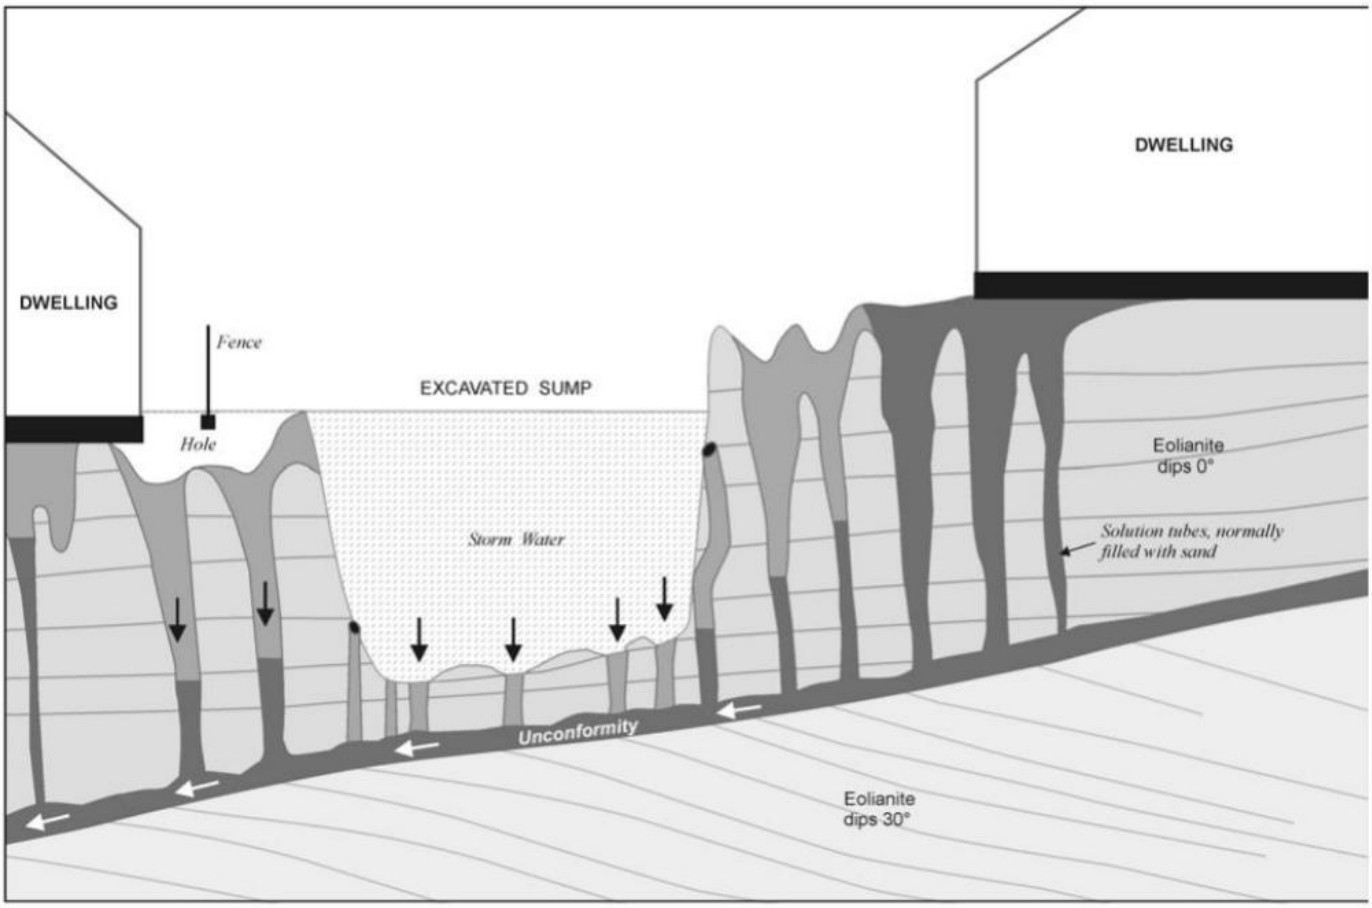
GDR4.1 Limestone

The term 'Limestone' is used to describe a carbonate rock. Tamala Limestone is the common limestone in Western Australia, and typically comprises cemented quartz and shell fragments cemented together by calcium carbonate.



Limestone can vary significantly across short distances in composition, strength and cementation. Tamala limestones in Western Australia also have known possible geological features including:

- Caprock/calcrete – The formation of a very hard duricrust, usually due to sun exposure. Caprock may be up to 3 m thick, but typically around 1.5 m thick. Caprock is very difficult to excavate and may require the use of hydraulic rock breakers or rock saws to excavate.
- Solution features/tubes – Often initially formed due to the presence of Eucalypt and Jarrah roots during limestone formation, and often increasing in depth and size due to ongoing weathering. May be up to 500 mm in diameter. These are typically filled with very loose, unconsolidated sand.
- Pinnacles – Pinnacles are usually the limestone that is left around surrounding solution features. Often can comprise very hard limestone/caprock that can be substantially higher than surrounding areas. Pinnacles may have also been formed by surrounding erosion (i.e., wind/water).
- Karst/caves – Karst is caused by the dissolution of limestone, typically where there is interaction in low-lying areas with water and limestone. Karst manifests itself as loose near-surface sand with cavities (caves) in the underlying limestone. This can lead to sinkholes and collapse of overlying structures.



Inline images showing typical pinnacle/solution features and Karstic features follow. These are taken from:

- Gordon, R. (2003). "Coastal Limestones". Australian Geomechanics Vol.38 No. 4, The Engineering Geology of Perth.
- Waltham, A. & Fookes, P. (2003). "Engineering Classification of Karst Ground Conditions: Quarterly Journal of Engineering Geology and Hydrogeology, Vol 36.

Inline Image GDR 1 - Karstic Sinkhole Features from Waltham and Fookes (2003)

Inline Image GDR 2: Pinnacle/Solution Features from Gordon (2003)

GDR4.2 Pindan Sands and Collapsible Soils

In the Western Australian context, Pindan sands are sandy soils present predominantly across the Pilbara and Kimberley regions. Pindan sands are typically:

- Red brown in colour.
- Between 10% and 40% fines.
- Of aeolian origin, usually resulting in unconsolidated in situ conditions (nuclear density gauge testing often indicates these soils have in situ density ratios of 80%-85% of modified maximum dry density).
- Very strong when dry due to high soil suctions in the fine fraction, which create strong bonds between the sand particles.

As the grains are usually held in place by the dry fine fraction, this can lead to:

- very high settlements (i.e., “collapse”) as the grain-to-grain bonds are weakened as matric suction decreases on soaking; and
- loss of vertical and horizontal strength/stiffness as the grain-to-grain bonds weaken.

The risks associate with Pindan sands are usually quantified in terms of the collapse potential/magnitude of possible collapse events.

Other similar soils are present in Western Australia that may exhibit similar collapse potential and may not strictly be Pindan sands (i.e., have other grain-to-grain bonding mechanisms).

GDR5 SITE CLASSIFICATION

Site classification refers to the assessment of a site in reference to AS2870-2011, “Residential slabs and footings”. The method for assessing the site class is outlined in Section 2 of AS2870-2011, which indicates that this may be done by:

- assessing the characteristic surface movement, due to seasonal moisture changes in the soil profile;
- assessing the performance of existing foundations; or
- assessment of the soil profile (where there are deleterious inclusions, landfill, putrescible waste etc.).

The site classifications based on the expected characteristic surface movement are summarised in Table GDR 1.

Table GDR 1: Summary of Site Classifications (AS2870-2011)

Class	Description	Characteristic Surface Movement (y_s)
A	Most sand and rock site with little or no ground movement from moisture change	Not Defined (typically <5 mm)
S	Slightly reactive clay sites with only slight ground movement from moisture changes	0 – 20 mm
M	Moderately reactive clay sites, which may experience moderate ground movements from moisture change	20 – 40 mm
H1	Highly reactive sites, which may experience high ground movements from moisture change	40 – 60 mm
H2	Highly reactive sites, which may experience very high ground movements from moisture change	60 – 75 mm
E	Extremely reactive sites, which may experience extreme ground movements from moisture change	>75 mm
P	Sites which include soft soils, such as soft clay or silt or loose sands; landslip; mine subsidence; collapsing soils; soils subject to erosion; reactive sites subject to abnormal moisture conditions or sites which cannot be classified otherwise	Not Defined

The calculated characteristic surface movement is predominantly based on:

- the reactivity (i.e., the shrink-swell potential) of the soil (and any proposed fill);
- the design depth of soil suction change, which is the maximum expected depth of soil suction change due to seasonal soil moisture changes; and
- the depth to any bedrock and groundwater table.

The design depth of soil suction change for Western Australia has been refined using the Thornthwaite Moisture Index (TMI). We have carried out assessment using the depths as detailed in:

- Hu Y, Saraceni P, Cocks G, Zhou M (2016). "TMI assessment and climate zones in Western Australia". Australian Geomechanics Journal, Vol.51 No.3.
- Hu Y, Raj A, Cocks G, Verheyde F (2019). "Re-assessment of TMI based climate zones in metropolitan Perth, WA". ANZ Geomechanics Conference 2019, Perth Australia.

The design depth of soil suction change for Northern Territory is based on the research presented in:

- Jackson, S (2022), "Thornthwaite moisture index and climate zones in the Northern Territory", Australian Geomechanics Journal, Vol. 57 No. 3.

We highlight that AS2870-2011 does not make any reference to the fines content of a soil when assessing the site classification.

Where a site classification is provided in our reports, it is always predicated on the requirement that the recommended site preparation procedures are carried out.

We also highlight that the footing performance and shrink-swell movements of a site can be impacted by the planting or removal of trees. This should be considered where appropriate, and we refer to the CSIRO BTF 18-2011 "Foundation Maintenance and Footing Performance: A Homeowner's Guide" for further information.

AS 2870 is limited to single and double storey residential buildings with normal shallow footings with a maximum bearing pressure of 100 kPa and is not applicable where development types other than this are proposed.

GDR6 SITE PREPARATION

GDR6.1 General

The intent of the site preparation guidelines provided in the above report are to ensure that the earthworks can be constructed to meet specific requirements, i.e., minimum compaction, fill requirements, removal of unsuitable material etc. The site preparation guidelines are not exhaustive, and on-site conditions may dictate that other preparation measures may be required to meet geotechnical requirements.

GDR6.2 Site Preparation

Site preparation measures outlined in this section relate to bulk earthworks at the site in preparation for the construction of buildings, pavements and other structures.

The preparation of a site in accordance with outlined measures below or those presented in the report text does not imply that the site is suitable for heavily loaded plant or eccentric loads. This is especially applicable for working platforms for mobile plant including cranes, crawlers or the like. The site surface may still not be trafficable for mobile plant. Individual working platform assessments must be done if heavily loaded mobile plant are proposed.

GDR6.2.1 Common Measures

The common measures outlined below are to prepare standard sites in advance of proof compaction, bulk excavation and filling. These measures are applicable to most sites, however the applicability of these measures is stated in the main report.

Table GDR 2: Common Measures

Measure	Commentary
Demolish and remove structures and pavements	Demolish existing structures and pavements, including removal of all buried services and footings and dispose off-site.
Remove demolition debris and other deleterious material	Remove any demolition debris and other deleterious material from site including old footings, slabs, soak wells, buried services, paving and building rubble.
Strip uncontrolled fill (where present)	Strip any uncontrolled fill from the site (where encountered) and, if suitable, stockpile it for potential re-use as non-structural fill. If contaminated, dispose off-site. Refer to the report text for discussions on the presence of detected uncontrolled fill and its composition. It is important to realise that undetected uncontrolled fill may be present between test locations and the absence of its identification in our report does not preclude its presence. If uncontrolled fill is detected during site works, please contact us for inspection and to provide recommendations.
Remove trees	All tree roots must be removed, this may result in significant excavation in places. Where tree roots and stumps are removed, the disturbed soil must be over-excavated and replaced with controlled, compacted fill. Backfilling of over-excavations is discussed in the following sections .
Strip and stockpile topsoil.	Strip and stockpile topsoil from unpaved areas of the site for potential re-use in non-structural applications. The topsoil strip is only necessary to remove roots and we recommend a topsoil strip as necessary to remove all roots from the soil.
Carry out bulk excavation	Excavate to the required level. Stockpile suitable excavated material for potential re-use as fill (the re-use of spoil as fill , if appropriate, is discussed in the report text) and remove unsuitable or excess material off-site.
Batter edges of excavation	Excavations should be battered to a temporary slope as given in the report text where applicable and not in close proximity to adjacent structures etc. If required, construct temporary/permanent retaining walls where batters cannot be accommodated.

By following these measures, the site should have been prepared to a point where topsoil and vegetation has been removed to expose either natural soil or controlled fill. Over-excavation to the required levels may then be required for some projects. Once complete, the site is now ready for proof compaction and filling.

GDR6.2.2 Sand Sites

The preparation measures outlined below are provided for sand sites meeting the following criteria:

- Site underlain by sand.
- No collapsible soils present.
- No deep loose sand.
- Compaction of a loose upper horizon to maximum 1 m depth.
- No shallow groundwater (<1 m deep).
- No limestone or other rock present at shallow depth.
- “Common Measures” outlined in Section GDR6.2.1 have been completed (as required).

The applicability of these measures is stated in the main report. These measures must be carried out for all areas where structures, footings, pavements and any other settlement-sensitive infrastructure is proposed.

Unless specified otherwise in the report, the **Approved Fill** to be used is outlined in Section GDR8 (**Permeable Sand** where permeable fill is required, else **General Sand**). The specific selection is subject to the requirements of the civil designer.

Table GDR 3: Sand Site Measures

Measure	Commentary
Moisture condition and proof compact.	Moisture condition and compact the exposed sandy ground to achieve the density specified in Section GDR7.1 ("sand") to a depth of at least 900 mm.
Test proof compaction	Check that the density specified in Section GDR7.1 ("sand") has been achieved to a depth of at least 900 mm. We note that the applicability of the use of the PSP for compaction control is discussed in the report. Unless specifically approved for use on the subject site, the contractor must **not** assume that the use of the PSP is appropriate.
Treat areas of loose or unsuitable material	Any areas of loose sand or unsuitable material (including over-excavated areas of former trees and root balls) must be removed and replaced with **Approved Fill** as outlined in the report or as noted above. The report will explain the suitability of site-derived materials for re-use as approved fill.
Carry out bulk filling	Where fill is required to build up levels, use **Approved Fill**, placed and compacted in layers of no greater than 300 mm loose thickness. Test compaction to achieve the density specified in Section GDR7.1.

In following this method, shallow/surficial loose sand will be compacted, and the site will be filled (where required) in preparation for supporting footings, ground slabs, pavements and the like.

GDR6.2.3 Deep Loose Sand Sites

The preparation measures outlined below are provided for sand sites meeting the following criteria:

- Site underlain by sand.
- Collapsible soils or deep loose sand present (if applicable, this is discussed in the report).
- Over-excavation, compaction and replacement of loose sand required.
- No shallow groundwater (<1 m deep).
- No limestone or other rock present at shallow depth.
- "Common Measures" outlined in Section GDR6.2.1 have been completed.

The greatest depth of compaction that can be achieved with standard compaction equipment (vibrating roller, etc) is around 1 m (for sands). As such, it is necessary to cut down the site level to a point where this compaction can be done to the lowest level needed to be improved.

The applicability of these measures is stated in the main report. These measures must be carried out for all areas where structures, footings and any other settlement-sensitive infrastructure are proposed. Not typically required for pavement subgrades, however, this is discussed in the report if required.

Unless specified otherwise in the report, the **Approved Fill** to be used is outlined in Section GDR8 (**Permeable Sand** where permeable fill is required, else **General Sand**). The specific selection is subject to the requirements of the civil designer.

Table GDR 4: Deep Loose Sand Site Measures

Measure	Commentary
Over-excavate to the required depth.	Over-excavate sand soil to the depth stated in the report and, if appropriate (discussed in report) retain it for re-use as fill. Over-excavation is likely to be done in stages depending on the site area available for earthworks. Excavations must be battered to a temporary slope as given in the report text where applicable and not in close proximity to adjacent structures etc. If required, construct temporary/permanent retaining walls where batters cannot be accommodated.
Moisture condition and proof compact.	Moisture condition and compact the exposed sandy ground to achieve the density specified in Section GDR7.1 ("sand") to a depth of at least 900 mm.
Test proof compaction	Check that the density specified in Section GDR7.1 ("sand") has been achieved to a depth of at least 900 mm. We note that the applicability of the use of the PSP for compaction control is discussed in the report. Unless specifically approved for use on the subject site, the contractor must **not** assume that the use of the PSP is appropriate.
Treat areas of loose or unsuitable material	Any areas of loose sand or unsuitable material (including over-excavated areas of former trees and root balls) must be removed and replaced with compacted **Approved Fill** as outlined in the report or as noted above. The report will explain the suitability of site-derived materials for re-use as approved fill.

Measure	Commentary
Carry out bulk filling	Where fill is required to build up levels (including restoration of the site surface level to the original level), use **Approved Fill**, placed and compacted in layers of no greater than 300 mm loose thickness. Test compaction as specified in Section GDR7.1.

In following this method, deep, loose sand will be compacted to a sufficient depth to reduce settlement impacts and the site will be filled (where required) in preparation for supporting footings, ground slabs, pavements and the like.

GDR6.2.4 Clayey Sites

The preparation measures outlined below are provided for sand sites meeting the following criteria:

- Site underlain by cohesive soils (typically >12% fines, i.e., clayey enough for the fines proportion of the soil to dominate behaviour).
- No collapsible soils present.
- No deep soft soils or organic soils.
- Over consolidated clayey soils present which will not be subject to significant primary or secondary consolidation (settlements expected to be within the limit of typical seasonal movements occasioned by moisture content changes, which would be captured in assignment of an AS2870 site classification).
- No shallow groundwater (<1 m deep)
- No rock present at shallow depth.
- "Common Measures" outlined in Section GDR6.2.1 have been completed.

The applicability of these measures is stated in the main report. These measures must be carried out for all areas where structures, footings, pavement subgrades and any other settlement-sensitive infrastructure is proposed.

Unless specified otherwise in the report, the **Approved Fill** to be used is **Clay** as outlined in Section GDR8.

Table GDR 5: Clay Site Measures

Measure	Commentary
Moisture condition and proof compact.	Moisture condition and compact the exposed clayey ground to achieve the density specified in Section GDR7.1 ("fine grained soils") to a depth of at least 300 mm.
Test proof compaction	Check that the density specified in Section GDR7.1 ("fine grained soils") has been achieved to a depth of at least 300 mm. The use of a penetrometer for compaction control of cohesive soils is not an appropriate substitute for in situ NDG testing.
Treat areas of loose or unsuitable material	Any areas of soft clayey soils or unsuitable material (including over-excavated areas of former trees and root balls) must be removed and replaced with compacted **Approved Fill**. The report will explain the suitability of site-derived materials for re-use as approved fill.
Carry out bulk filling	Where excavations are done into clayey soils (e.g. to treat soft zones, remove root balls and the like), they must not be backfilled filled with sand fill (even where a sand topping layer is proposed). Where fill is required (including backfilling of excavations to remove trees), only use **Approved Fill**, moisture conditioned, placed and compacted in layers of no greater than 300 mm loose thickness. Test moisture and compaction as specified in Section GDR7.1.
Grade completed clayey surface	Surface water control is essential for clayey sites. This also applies to control of infiltrated water into sand topping layers or the like. The surface of clayey ground must be graded at a minimum of 1% crossfall to drain. This is a general recommendation, and an appropriate civil design must be done to account for surface and subsoil drainage.
Install sand topping layer	Where a sand topping layer is proposed, this should be done as outlined in Section GDR6.2.5.

These measures do not take into account the objectives of the civil design for the site, particularly with regard to surface water drainage and groundwater control (including clay grading, subsoil drainage, thickness and composition of a sand topping layer and the like). This must be taken into account by the civil designer. General commentary on drainage control measures is presented in Section GDR14.

GDR6.2.5 Sand Topping Layer

Where a sand topping layer is required:

Unless specified otherwise in the report, the **Approved Fill** to be used is outlined in Section GDR8 (**Permeable Sand** where permeable fill is required, else **General Sand**). The specific selection is subject to the requirements of the civil designer.

Table GDR 6: Sand Topping Layer Measures

Measure	Commentary
Prepare Substrate	Prepare the clayey or other substrate as separately outlined prior to installing the topping layer.
Build up sand topping layer	Build up level to the required level with **Approved Fill**, placed and compacted in layers of no greater than 300 mm loose thickness to achieve the density specified in Section GDR7.1.

For the purposes of achieving the allowable bearing pressures and site classification discussed in the report, it is not necessary to have the bases of slabs and footings in the sand topping layer, i.e. if required, they may extend through the sand topping layer into clayey soil below.

GDR6.2.6 Limestone Sites

The preparation measures outlined below are provided for sites underlain by limestone (refer to Section GDR4.1), meeting the following criteria:

- Site underlain by sand overlying limestone.
- Compaction of a loose upper horizon to maximum 1 m depth, with localised deeper treatments between pinnacles if required.
- No shallow groundwater (<1 m deep)
- “Common Measures” outlined in Section GDR6.2.1 have been completed.

The site preparation measures outlined below are aimed at improvement of the site in preparation for construction of the structures including on-ground slabs, shallow footings, retaining walls and pavements.

Unless specified otherwise in the report, the **Approved Fill** may comprise one of the following as specified in Section GDR8 (the specific selection is subject to the requirements of the civil designer):

- **Permeable Sand** where permeable fill is required
- **General Sand** where permeable fill is not required
- **Mixed Sand/Limestone Fill** where permeable fill is not required

The re-use of any limestone for fill is subject to the requirements of the civil design and discussions in the report text. The use of **Mixed Sand/Limestone Fill** is discussed in Section GDR6.2.7. The preparation measures outlined in Table GDR 7 assume sand fill.

Table GDR 7: Standard Limestone Site Measures (Bulk Earthworks)

Measure	Commentary
Treat zones of loose sand	Where deep loose sand is present (particularly, but not exclusively, between limestone pinnacles), over-excavate to the depth as noted in the report . Sand should be retained for re-use as fill if recommended in the report. Limestone debris and pinnacles should be separated and only re-used if recommended in the report.
Moisture condition and proof compact.	Moisture condition and compact the exposed sandy ground to achieve the density specified in Section GDR7.1 ("sand") to a depth of at least 900 mm. Proof compaction of intact limestone is not required.
Test proof compaction	Check that the density specified in Section GDR7.1 ("sand") has been achieved to a depth of at least 900 mm. We note that the applicability of the use of the PSP for compaction control is discussed in the report. Unless specifically approved for use on the subject site, the contractor must not assume that the use of the PSP is appropriate. If refusal to the test method is encountered within the target test depth on limestone and the results to the refusal depth are acceptable, it is not necessary to repeat compaction testing at that location. Compaction control of intact limestone is not required.
Treat areas of loose or unsuitable material	Any areas of loose sand or unsuitable material (including over-excavated areas of former trees and root balls) must be removed and replaced with compacted **Approved Fill** as outlined in the report or as noted above. The report will explain the suitability of site-derived materials for re-use as approved fill.
Carry out bulk filling	Where fill is required to build up levels, use **Approved Fill**, placed and compacted in layers of no greater than 300 mm loose thickness. Test compaction to achieve the density specified in Section GDR7.1.

These measures do not take into account the specifics of the civil design, including the requirement (if any) for excavatable and/or free draining layers to achieve construction and drainage objectives. The civil design must take precedence and is not specifically considered in this advice.

Soakwells can perform poorly in limestone and specific advice may apply to the installation of soakwells in limestone areas. If not discussed in our report, please contact us for further advice.

Without further consultation with the structural designer, footings for any one structure must not be founded on a mixture of sand and intact limestone. This is due to potential differential settlements between limestone zones (relatively stiff) and soil zones (relatively soft). Where this is the case, the measures outlined in Table GDR 8 must be followed, only with guidance from the structural designer and Galt.

Table GDR 8: Standard Limestone Site Measures (Footing and Slab Preparation)

Measure	Commentary
Excavate and compact for slabs, subgrades, pad or strip footings	Excavate for pad and strip footings. Where a mix of soil and limestone is present below any one structure, one of the following must be done (to be agreed with structural designer and us): ▪ **Over-excavate limestone and replace with compacted soil:** Typically where the foundation largely comprises soil and a relatively small amount of limestone is present. Where footings and slabs are founded partly on soil and partly on limestone, over-excavate the limestone by at least 300 mm below the base of footing or slab and replace the excavated material with compacted **Approved Fill**. ▪ **Remove soil from over limestone and replace with concrete**: Typically where the foundation largely comprises limestone and a relatively small amount of soil is present. Localised zones of sand and mixed sand/limestone rubble must be removed and replaced with lean-mix concrete, e.g. 10 MPa blinding concrete. ▪ **Design the structure to accommodate differential foundation movements:** For example, include construction joints or use a more heavily reinforced footing (subject to the structural designer's requirements).
Test compaction of footing bases, slabs or subgrades.	Compact the exposed bases to achieve the density specified in Section GDR7.1 ("sand"), to a depth of at least 900 mm, or to the depth where limestone is intersected. If refusal to the test method is encountered within the target test depth on limestone and the results to the refusal depth are acceptable, it is not necessary to repeat compaction testing at that location. Compaction control of intact limestone is not required. Remove, replace and compact as required with approved fill any zone not achieving the density specified in Section GDR7.1 ("sand")

GDR6.2.7 Mixed Sand/Limestone Filling

On sites where deemed appropriate by the Civil Design, **Approved Fill** may comprise limestone rubble fill (**Mixed Sand/Limestone**, as specified in Section GDR8).

The preparation measures outlined below are provided for sites meeting the following criteria:

- No shallow groundwater (<1 m deep)
- "Common Measures" outlined in Section GDR6.2.1 have been completed.
- Substrate preparation for the relevant site type has been done in preparation for further filling (as relevant for sand, limestone or clayey sites discussed in the preceding sections).

The site preparation measures outlined below are required prior to construction of structures including on-ground slabs, shallow footings, retaining walls and pavements.

Table GDR 9: Mixed Sand/Limestone Fill Measures

Measure	Commentary
Develop a method specification for the filling	A performance specification is not appropriate for compaction control in **Mixed Sand/Limestone** fill, due to oversize limestone particles and the limitations of test methods. Therefore, a method specification is required. Development of a method specification is discussed in Section GDR7.5. A tentative method specification for **Mixed Sand/Limestone** Fill preparation is also provided.
Carry out bulk filling	Where fill is required to build up levels, use **Approved Fill**, placed and compacted in accordance with the developed method specification.
Maintain Construction Records	As performance testing cannot be done, quality assurance records are limited. Therefore, the parameters mentioned in Section GDR7.5.1 must be kept in a comprehensive record of the earthworks done to the developed method specification. The use of the PSP is possible only to check for loose sand zones between limestone particles. High PSP blow counts, where limestone particles are intersected, are meaningless in terms of assessing density of the prepared fill. The primary means of validation of the earthworks is conformance with the developed method specification.
Install sand topping layer	Where a sand topping layer is proposed, this should be done as outlined in Section GDR6.2.5.

These measures do not take into account the specifics of the civil design, including the requirement (if any) for excavatable and/or free draining layers to achieve construction and drainage objectives. The civil design must take precedence and is not specifically considered in this advice.

Soakwells can perform poorly in limestone fill and specific advice may apply to the installation of soakwells in limestone fill areas. If not discussed in our report, please contact us for further advice.

GDR6.2.8 Rock Sites

The preparation measures outlined below are provided for sites underlain by rock, meeting the following criteria:

- Site underlain by shallow soil overlying rock, or outcropping rock.
- No shallow groundwater or surface water (>1 m deep).
- Common site preparation measures outlined in GDR6.2.1 have been completed. In addition to these measures, any surface cobbles/boulders will need to be removed from the site.

The site preparation measures outlined below are aimed at improvement of the site for construction of structures including on-ground slabs, shallow footings, retaining walls and pavements.

Approved Fill will be as specified in this report. The re-use of any rock for fill is subject to the civil design requirements and any other requirements noted in the report text. The preparation measures outlined below assume **Approved Fill**.

Table GDR 10: Standard Rock Site Measures (Bulk Earthworks)

Measure	Commentary
Moisture condition and proof compact.	Moisture condition and compact the exposed ground (soil above rock) to achieve the density specified in Section GDR7.1 to a depth of at least 300 mm. Proof compaction of rock is not required.
Test proof compaction	Check that the density specified in Section GDR7.1 has been achieved to a depth of at least 300 mm. in situ NDG testing is suitable to assess compaction. Compaction control of intact rock is not required.
Treat areas of loose or unsuitable material	Any areas of loose / soft or unsuitable material (including over-excavated areas of former trees and root balls) must be removed and replaced with compacted **Approved Fill** as outlined in the report or as noted above. The report will explain the suitability of site-derived materials for re-use as **Approved Fill.**
Carry out bulk filling	Where fill is required to build up levels, use **Approved Fill**, placed and compacted in layers of no greater than 300 mm loose thickness. Test compaction to achieve the density specified in Section GDR7.1.
Grade surface	Surface water control may be required for lower permeability soils/rock, or at an interface where high permeability fill is placed over relatively impermeable soils/ rock. The surface of any impermeable ground / rock must be graded at a minimum of 1% crossfall to drain. This is a general recommendation, and an appropriate civil design must be done to account for surface and subsoil drainage.

These measures do not take into account the specifics of the civil design, including the requirement (if any) for excavatable and/or free draining layers to achieve construction and drainage objectives. The civil design must take precedence and is not specifically considered in this advice.

Soakwells can perform poorly in rock and specific advice may apply to the installation of soakwells in these areas. If not discussed in our report, please contact us for further advice.

Without further consultation with the structural designer, footings for any one structure must not be founded on a mixture of sand and rock. This is due to potential differential settlements between rock zones (relatively hard) and soil zones (relatively soft). Where this is the case, the measures outlined below must be followed, only with guidance from the structural designer and Galt.

Table GDR 11: Standard Rock Site Measures (Footing and Slab Preparation)

Measure	Commentary
Excavate and compact for slabs, subgrades, pad or strip footings	Excavate for pad and strip footings. Where a mix of soil and rock is present below any one structure, one of the following must be done (to be agreed with structural designer and us): ▪ **Over-excavate rock and replace with compacted soil:** Typically where the foundation largely comprises soil and a relatively small amount of rock is present. Where footings and slabs are founded partly on soil and partly on rock, over-excavate the rock by at least 300 mm below the base of footing or slab and replace the excavated material with compacted **Approved Fill**. ▪ **Remove soil from over rock and replace with concrete**: Typically where the foundation largely comprises rock and a relatively small amount of soil is present. Localised zones of sand and mixed sand/rock rubble must be removed and replaced with lean-mix concrete (e.g. 10 MPa blinding concrete) or cement stabilised sand (minimum UCS=2 MPa at 7 days). ▪ **Design the structure to accommodate differential foundation movements:** For example, include construction joints or use a more heavily reinforced footing (subject to the structural designer's requirements).

Measure	Commentary
Test compaction of footing bases, slabs or subgrades.	Compact the exposed bases to achieve the density specified in Section GDR7.1, to a depth of at least 300 mm, or to the depth where rock is intersected. If refusal to the test method is encountered within the target test depth on rock and the results to the refusal depth are acceptable, it is not necessary to repeat compaction testing at that location. Compaction control of intact rock is not required. Remove, replace and compact as required with **Approved Fill** any zone not achieving the density specified in Section GDR7.1.

GDR6.3 Guidance on Sites with Cohesive Soils

Cohesive soils (most commonly, "clayey" soils) require careful moisture conditioning to facilitate compaction. We recommend that the moisture content of the material is between optimum moisture content (OMC) and 2% wet of OMC at the time of placement and compaction. We note that compaction to the densities specified in Section GDR7.1 can be difficult to achieve for clayey material when not appropriately moisture conditioned.

Vibratory padfoot rollers are preferred for compacting cohesive fill to promote proper kneading and interlocking of subsequent layers.

Clayey soils will drain poorly when inundated following rain events and result in saturated conditions that may inhibit compaction of the soil. In general, it is preferable to avoid trying to re-work clayey sites within several days of any substantial rainfall.

We recommend that the surfaces of clayey sites are sealed by compaction (i.e., final compaction should be with a smooth drum roller) and graded to drain (to avoid low spots where water can pond and cause softening) prior to any rain events. Stripping back of softened materials to expose competent natural or compacted clayey soil is required before continuing earthworks.

If difficulties are experienced during compaction due to water, further advice should be sought from a geotechnical engineer.

GDR6.4 Preparation and Testing of Shallow Footings

GDR6.4.1 General

It is preferable to dig all footing excavations carefully with a flat-edged bucket to minimise the disturbance of underlying foundation soil.

Where the footing base is disturbed, or compaction is required, this must be done using appropriate compaction equipment particular to the task (as evaluated by the contractor) – typically a 'jumping jack', self-propelled plate compactor or an excavator-mounted plate compactor.

All footing bases must be tested to achieve the density requirements of Section GDR7.1 unless otherwise specified. PSP testing of sand foundations is only applicable where the use of the PSP is specifically approved in the report, otherwise all testing is to be done using the NDG.

Sand Topping Layer – Where a sand topping layer is present over a different soil (i.e., clay, limestone etc.), testing of the density of the sand topping layer is only necessary within the thickness of the sand topping layer. Testing does not need to extend into the underlying compacted substrate, which is separately subjected to compaction control.

Mixed Sand/Limestone Fill – Where mixed sand/limestone fill has been installed to a method specification, no compaction control testing is required, however re-compaction of the base must be done as noted above.

In situ limestone – where in situ limestone (weakly or more cemented limestone, with no sand zones or voids) is present at a footing base and no over-excavation has been done (refer to Section GDR6.2.6 regarding over-excavation of footing bases in limestone), then no compaction control testing is required.

Where loose or soft material is encountered, one of the following actions must be taken:

- Over-excavate the loose / soft layer to expose a suitable layer that does meet the required density (Section GDR7.1) and either:
- Place and compact Approved Fill (relevant to the appropriate preparation measures outlined in Section GDR6.2) to achieve the required density (Section GDR7.1); or

- Pouring blinding concrete (f'c>15 MPa at 28 days) from the competent layer up to the underside of the footing.

All foundations must be assessed by a competent person prior to blinding.

GDR6.4.2 Footings in Clay

Where footings are excavated into natural clay and not subject to filling, density testing (e.g., NDG testing) is not required at the base of the footings. This will be highlighted in the report text if this is relevant to the site conditions. Footing bases must be dug with a flat-edged excavator bucket and the underlying soil not disturbed by trafficking or over-excavation.

In these instances, only testing with a DCP is required in accordance with AS1289.6.3.2 at the footing base to achieve the required blow counts indicated in the report text, to a minimum depth of 0.6 m below the base of the footing, or other depth as indicated in the report text. Where the minimum blow count specified cannot be met, the following options are possible to prepare the footing base:

- Scarify, moisture condition and re-compact all zones not achieving the minimum blow counts. Re-test with a DCP to confirm that any soft zones are remediated; or
- Over-excavate and replace all zones not achieving the minimum blow counts with a suitable compacted low permeability fill (e.g., crushed limestone, clayey fill or other approved fill). This fill must be compacted to the appropriate level as specified in GDR7; or
- Over-excavate and replace all zones not achieving the minimum blow counts with blinding concrete (min. 10 MPa at 28 days) or cement-stabilised sand (min. 2 MPa at 7 days). This is typically appropriate where only the upper zones below the footing base are soft.

Measures must be taken to minimise moisture changes in clayey foundation soils at the base of footing excavations. Concrete footings are to be poured soon after excavation to minimise the potential for excessive moisture change. The use of a concrete blinding layer following foundation preparation should be considered.

GDR7 COMPACTION AND MOISTURE CONDITIONING

GDR7.1 Requirements

Any soil within the significant founding zone of structures (buildings, slabs, pavements, etc.) must be suitably moisture conditioned and compacted. These soils must be compacted to the requirements as outlined below.

Table GDR 12: Compaction and Moisture Requirements

Soil Description	Soil Particle Limits	Moisture Requirement	Density Requirement (DDR)	Possible QA/QC Test Methods
Sand	<5% fines <5% gravel *Maximum particle size 9.5 mm*	MOMC ±2%	95% MMDD	PSP NDG
Gravel	<5% fines >50% gravel *Maximum particle size 19.0 mm*	MOMC ±2%	95% MMDD	NDG
Clayey/Silty Gravel	5-35% fines >50% gravel *Maximum particle size 19.0 mm*	MOMC ±2%	95% MMDD	NDG
Sand with fines or gravel	5-35% fines; and/or 5-50% gravel *Maximum particle size 19.0 mm*	MOMC ±2%	95% MMDD	NDG Method Specification
Fine grained soils (Clayey or Silty)	>35% fines *Maximum particle size 19.0 mm*	MOMC ±2%; or SOMC ±2%[2]	92% MMDD; or 95% SMDD	NDG Method Specification
Oversize/rubbly soil	Any soils with particles >19.0 mm	MOMC ±2%	95% MMDD (Or equivalent to)	Method Specification Detailed Assessment Based on Specific Material

NOTES: ***1.*** *DDR – Dry Density Ratio*

MMDD – Modified maximum dry density (AS1289.5.2.1)
MOMC – Modified optimum moisture content (AS1289.5.2.1)
SMDD – Standard maximum dry density (AS1289.5.1.1)
SOMC – Standard optimum moisture content (AS1289.5.1.1)
PSP – Perth Sand Penetrometer
NDG – Nuclear Density Gauge

2. *Preferably OMC to OMC +2%, for ease of compaction and producing a homogenous fill*
3. *Test frequencies are specified in Section GDR7.6.*

The soil groups and definitions outlined above are generally based on AS1726-2017. Test methods are discussed in subsequent sections.

GDR7.2 Construction Recommendations

Over-excavation and replacement of loose material must be done where the minimum DDR cannot be achieved.

Fill must be placed in horizontal layers of not greater than 300 mm loose thickness. Each layer must be compacted by suitable compaction equipment, and carefully controlled to ensure even compaction over the full area and depth of each layer.

Care will need to be taken if compacting in the vicinity of existing structures, such as the adjacent properties. This is particularly important if vibratory compaction is being carried out.

- Tynan (1973), "Ground Vibration and Damage Effects on Buildings", Australia Road Research Board, Special Report No. 11.

Tynan (1973) provides guidance on the selection of compaction equipment for use adjacent to structures. The distance of influence (i.e., the definition of "vicinity") will vary depending on the size of compaction plant proposed for use. Where there is concern regarding the impact on nearby structures, a dilapidation study should be done.

Care must be taken when compaction is undertaken when the site surface is within 1 m of the groundwater level, as compaction (particularly with vibration) can draw the water up to the surface. In this instance, consideration should be given to:

- Static rolling only;
- Using a pioneering layer (if possible); or
- Dewatering to keep the water at least 1 m below the surface being compacted.

GDR7.3 Nuclear Density Gauge

Where applicable, a nuclear density gauge (NDG) must be used in accordance with AS1289.5.8.1. NDG tests must be done to a depth of 300 mm or as otherwise indicated in the text of the attached report.

GDR7.4 Perth Sand Penetrometer

Where clean sand is used (<5% fines and <5% gravel), a Perth sand penetrometer (PSP) may be used for compaction control in accordance with AS1289.6.3.3. Refer to the report for recommended blow counts correlating to the specified density.

Where the fines or gravel contents of a sand soil exceed the maximum contents noted above, a PSP must not be used exclusively for compaction control. As a minimum, ongoing confirmation testing with an NDG is required. If not specified in our report, please contact us for further advice regarding test frequencies.

If difficulties are experienced recording the required blow counts, a site-specific PSP correlation should be carried out to determine the PSP blow count correlating to a DDR of 95% MMDD. In addition, a particle size distribution (PSD) test should be carried out to verify that the use of a PSP is suitable for the sands being tested. A site-specific PSP correlation must:

- be done on site;
- use the nuclear density gauge (NDG) to determine density at a minimum of 5 points with varying density to a depth of 300 mm below surface;
- include at least 1 point where the dry density ratio is in excess of 95% MMDD;
- use a calibrated PSP to determine the PSP blow count from 150 mm to 450 mm at each NDG test point; and
- be plotted on a chart of PSP blow count vs DDR.

Only where specifically stated as applicable in the report and where the use of the PSP is relevant as noted above, the following values may be taken as deemed to conform to a dry density ratio of 95% MMDD for the relevant sand type.

Table GDR 13: Deemed-to-comply Values for PSP Results in Perth Sands

Depth Interval (mm)	Bassendean	Tamala	Calcareous
0-150	SET	SET	SET
150-450	7	8	12
450-750	9	10	14
750-1050	11	12	16

NOTES:
1. *Blows per 300 mm interval*
2. *Bassendean Sand is typically a white - grey, low-fines quartz sand found on the eastern part of the Perth coastal plain*
3. *Tamala / Spearwood sand is typically yellow or orange, low-fines quartz sand found on the western part of the Perth coastal plain*
4. *Calcareous sands are typically white or yellow, calcareous sand found in low-lying areas on the western fringe of the Perth coastal plain*
5. *Values derived from Galt experience on PSP correlations done on sites across Perth for the 150-450 mm interval.*

GDR7.5 Method Specifications

GDR7.5.1 General

Where proposed, a method specification should be developed by a geotechnical engineer or similarly qualified person and ratified by us (including a site visit by us). The method specification should be confirmed by the construction of a trial pad or trial area and the compaction methodology should be checked against either:

- density, as assessed using a nuclear density gauge; or
- settlement, as assessed using a dGPS.

Specific advice should be requested for the development of a method specification, taking into consideration the material being compacted.

Method specification compliance should be maintained for all areas on a minimum 20 m grid, with the compliance to include:

- Roller used (weight, style, vibration);
- Water application rate (per lift);
- Layer thickness placed; and
- Number of passes with roller.

GDR7.5.2 Indicative Method Specification – Sand/Limestone Rubble Mix

Where mixed sand/limestone is used as structural fill, a performance specification is not appropriate due to the inaccuracies of standard test methods (NDG/PSP etc.) in this type of material. A method specification can be used instead. The following indicative method specification is provided for evaluation and trial but must be trialled and ratified by us prior to widespread employment on site. The following would be typically adopted:

- Maximum particle size: 250 mm
- Maximum loose layer thickness: 350 mm
- Minimum watering rate: 10 L/m^2/100 mm thickness of loose material (e.g. 35 L/m^2 for a 350 mm thick layer)
- Minimum 8 passes with a vibrating padfoot roller, minimum static weight 10 tonnes.
- The compacted fill must comprise closely packed particles without any significant voids between the larger particles.

GDR7.6 Testing Frequency

After compaction, verify that the required density has been achieved by testing at the base of excavation and through the full depth of any fill, and to a minimum depth of:

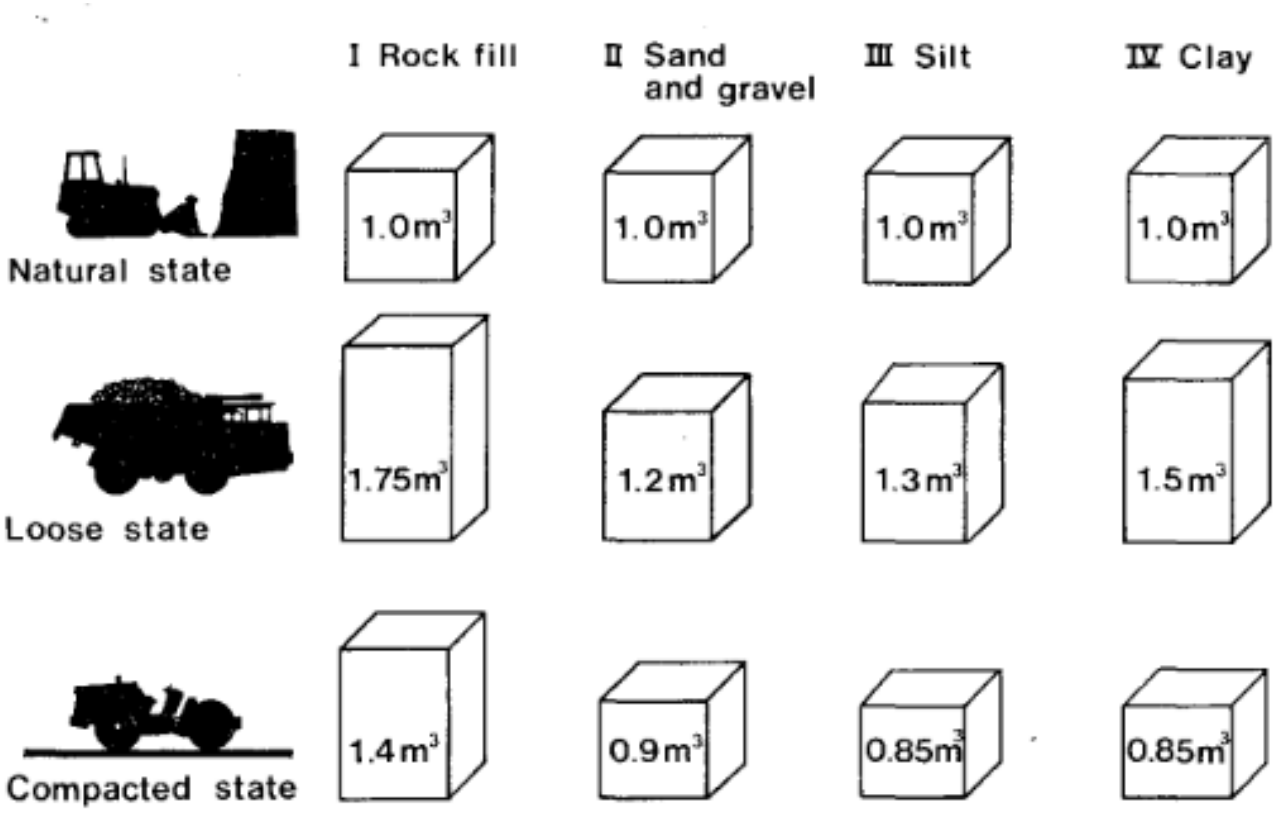
- 900 mm where a PSP is used; or
- 300 mm where a NDG is used.

The frequency of testing (when a method specification is not used) should be as follows:

Table GDR 14: Compaction Testing Frequency Requirements

Area	Minimum Testing Frequency	Minimum Tests Per Lot
Proof Compacted Area	1 test per 1,000 m^2 (30 m grid)	2
Structural Fill Outside of Building and Pavement Footprints	1 test per 500 m^3 2 tests per layer *Whichever is greater*	2
Structural Fill Within Building and Pavement Footprints	1 test per 500 m^3 4 tests per layer *Whichever is greater*	4
Spread/Pad Footings	1 test per 9 m^2 per footing	1
Strip Footings/Retaining Wall Foundations	Minimum 2 tests At 5 m centres *Whichever is greater*	2
On-ground slabs, pavements and rafts	Minimum 2 tests At 10 m centres 1 test per 100 m^2 *Whichever is greater*	2

NOTES: ***1.*** *A 'lot' is defined in the context of this section as a section of earthworks that is undertaken in one operation where the equipment, personnel, materials and methodology are consistent throughout the entire process. This would typically be limited to operations done in one day, but this is not mandatory.*



2. *There will frequently be multiple 'lots' in an earthworks process, therefore the number of tests must be adjusted according to the minimum number per lot in this table (where this is more than the frequency specified in 'testing requirements').*

GDR7.7 Bulking and Compaction Factors

All soils will "bulk" when excavated to stockpile, and "compact" when placed from stockpile to earthworks layers. Published bulk and compaction factors are presented below for conventional materials, taken from:

- Forssblad, L (1981), "Vibratory Soil and Rock Fill Compaction", Dynapac Maskin AB

Inline Image GDR 3: Volumes of Different Types of Fill Materials in Natural, Loose and Compacted State

These values are indicative only and will vary according to site specific conditions. The values provided here must not be used for commercial volume estimates or settling disputes regarding volumes.

GDR8 APPROVED FILL AND CONFORMANCE TESTING

Imported fill must comply with the material requirements as stated in AS 3798-2007, “Guidelines on Earthworks for Commercial and Residential Developments”.

Where doubt exists, a geotechnical engineer must be engaged to inspect and approve the use of potential fill materials.

The following table presents recommended material parameters for standard fill types. This does not take account of availability of materials either on site or in the local area. Refer to the report text for specific advice on fill at the subject site.

Table GDR 15: Standard Fill Recommendations

Soil Description	Application	Soil Particle Limits (%)[3]				k_{min}[1] (m/d)	OC[2] (%)	Atterberg Limits		CBR[6] (%)	Test Method[4]
		Fines	Sand	Gravel	Max.			LL (%)	PI (%)		
Permeable Sand	Permeable bulk fill Retaining wall backfill Permeable select fill	≤5	≥90	≤5	9.5	5	≤2	NP	NP	≥12	PSP NDG
General Sand	Bulk fill Select fill (permeability not required)	≤5	≥90	≤5	9.5	N/A	≤2	NP	NP	≥12	PSP NDG
Silty Sand	Bulk fill Select fill	≤35	≥55	≤10	9.5	N/A	≤2	<35	<11	≥12	NDG
Clayey Sand	Bulk fill Select fill	≤35	≥55	≤10	9.5	N/A	≤2	<40	N/A	≥12	NDG
Granular Fill	Bulk Fill	≤30[10]	Varies[10]	Varies[10]	37.5	N/A	≤2	<40	N/A	N/A	NDG
Mixed Sand/Limestone	Bulk fill (permeability not required)	≤5	≥20	≤80	250	N/A	≤2	NP	NP	N/A	NDG Method
Blue Metal Gravel[8]	Retaining wall backfill Drainage trench backfill	≤3	≤5	≥90	37.5	5	≤1	NP	NP	N/A	NDG
Clay[7]	Reinstatement of localised excavations in clay Bulk fill	≥12	Varies	≤30	19	N/A	≤2	Varies			NDG

NOTES:

1. *k_{min} – minimum saturated hydraulic conductivity (AS1289.6.7.1, remoulded to minimum DDR 100% MMDD).*
2. *OC – organic content (Walkley-Black method recommended, AS1289.4.1.1 – not loss on ignition methods)*
3. *% by mass.*
4. *Test method indicates possible compaction control methods for this material.*
   PSP – Perth sand penetrometer (AS1289.6.3.3). Where a PSP is used, a site-specific correlation must be done unless otherwise noted in the report.
   NDG – Nuclear density gauge (AS1289.5.8.1)
   Method – method specification
5. *Atterberg Limits: LL – liquid limit PI – plasticity index NP – non-plastic*
6. *CBR: California bearing ratio (for sand - remoulded to DDR 95% MMDD @ OMC, 4.5 kg surcharge). CBR values may be changed depending on the design pavement requirements.*
7. *"Clay" fill type is included for broad reference only and to illustrate preferred applications, particle size limits and recommended test method. Specific discussion on the use of clayey fills is included in the report text if applicable. Atterberg limit and CBR testing of clayey fills may be required and advice must be sought from us if not stated in the report.*
8. *"Blue metal" gravel refers to single sized, crushed, washed igneous rock gravel used for drainage purposes.*
9. *In the absence of specific test frequencies by the civil designer, the testing shown in Table GDR 16 must be done (highlights in Table GDR 15 show where the test is required).*
10. *Sand and gravel must be reasonably graded to control the risk of soil ingress from surrounding layers. Where the fines content is high (e.g. above ~15%), the gravel content should proportionally increase to meet the requirements for "granular fill". We recommend a minimum gravel content of 30% where the fines content is above 15%.*

Table GDR 16: Conformance Testing Frequency Requirements

Parameter	Frequency (m^3)	Minimum Tests per Source	AS1289 Reference
Particle size distribution	5,000	1	3.6.1
Hydraulic conductivity (permeability)	10,000	2	6.7.1
Organic content	5,000	1	4.1.1
Atterberg limits	5,000	1	3.1.1, 3.2.1, 3.3.1
CBR	10,000	2	6.1.1

NOTES: ***1.*** *Frequency is for the nominal number of cubic metres of compacted fill.*

2. *Unless stated otherwise in the report text, the conformance testing must also be carried out on site-derived materials to confirm suitability.*

GDR9 SHALLOW FOUNDATIONS

GDR9.1 Design

Footings and slabs may be designed in accordance with the assigned site classification in accordance with AS2870-2011. We note that AS2870-2011 is limited to single and double storey residential and commercial developments and may not be strictly applicable.

Where the report provides tables for shallow footing design, custom footings may be designed by the structural engineer using the data provided therein.

GDR9.2 Interpretation of Provided Values

BEARING PRESSURES

All settlement and bearing pressures estimates are provided on the assumption that the site preparation requirements outlined in the report are completed below all structures plus a minimum distance of 1 m beyond the outside edge of any footing or slab. It is essential that the soil below all foundations is appropriately prepared as outlined and meets the relevant compaction requirements.

Allowable bearing pressures for footings of intermediate plan dimensions (to any tabulated) can be interpolated. Footings that have a plan dimension either smaller or larger than those presented in the report will need to be considered individually along with other embedment depths.

Allowable bearing pressures, where provided, are considered to be the upper limit for shallow footings to limit total and differential settlements. Footings carrying eccentric loading, such as below retaining walls, must be assessed separately.

SETTLEMENTS

The reporting of settlements to any precision level is not intended to imply a high accuracy of settlement prediction. Settlements as reported should be considered ‘order of magnitude’.

Estimated settlements represent vertical downwards movement due to loading and do not take into account potential additional movement associated with the characteristic surface movement of the soil (which must be taken in addition to these settlements from loading, refer Section GDR5). The site classification is discussed in the report.

The actual settlement of any proposed structure will depend upon a number of factors including the applied pressures, footing size and base preparation. The estimated settlement(s) provided in this report are for the working bearing pressures as indicated. Differential settlements are likely between footings of similar sizes, loads and elevations (as stated in the report text). A proportion of the settlement is expected to occur during construction (i.e., during initial loading.

The provided settlement estimates (unless otherwise stated) do not include interaction effects from footings founded near other footings (i.e., groups of footings). Interaction effects will need to be considered if the spacing between adjacent footings is smaller than the dimension of the footings (i.e., the centre-to-centre spacing between footings is less than twice the width of the footing). This could act to double provided settlements, dependent on the footing configuration. Where an assessment of footing groups is required, a more detailed numerical or finite-element modelling analysis would need to be undertaken.

CREEP AND CONSOLIDATION

Creep settlement is an irreversible component of long-term soil settlement caused by sustained vertical stress. Consolidation is a time-dependent irreversible compression in a soil layer caused by a reduction in pore pressure between soil particles. Both creep and consolidation can occur in natural materials as a result of earthworks or the placement of loads on to soil layers. The settlements as presented for short-term loading do not include consideration for creep and consolidation settlements unless specifically stated.

GDR9.3 Raft Foundations

Where moduli of subgrade reactions are provided for the design of raft foundations, we highlight that these are an estimate of the elastic reaction of the soil. The values are provided based on an expected load and loaded area size. Soils are typically non-linear in their response and will have different stiffnesses at different levels of strain and load repetitions. This is due to the physical interaction of soil particles under different levels of stress.

The possibility of a non-linear response must be considered by the designer of any raft foundation.

GDR10 PILED FOUNDATIONS

Piles must be designed and tested in accordance with AS2159-2009, “Piling – Design and Installation”. We use the following interpretation/design methods to provide pile design parameters:

- Franki Africa Pty Ltd (2008) “A Guide to Practical Geotechnical Engineering in South Africa”. 4th ed.
- AFNOR (2012) “NF P 94-262 – Justification des ouvrages géo-techniques, Normes d’application nationale de l’Eurocode 7”, Afnor, Paris, July 2012.
- Lehane, B. (2017) “CPT-Based Design of Foundations”. E.H Davis Memorial Lecture, Australian Geomechanics Vol 54. No. 4.
- Lehane, B. et al. (2020) “A New ‘Unified’ CPT-Based Axial Pile Capacity Design for Drivel Piles in Sand”. Proceedings of the Fourth International Symposium on Frontiers of Offshore Geotechnics.
- Doan., Lehane, B. (2021) “CPT-Based Design Method for Axial Capacities of Drilled Shafts and Cast-in-place Piles.” American Society of Civil Engineers (ASCE), Journal of Geotechnical and Geoenvironmental Engineering.

The pile designer must:

- consider the possible variation in subsurface conditions at each pile location;
- consider any pile group effects based on the final piling configuration;
- assume that the unit shaft resistance in tension is less than 80% of the unit shaft resistance in compression to account for Poisson’s effect in sand;
- ignore pile resistance in the surficial 0.5 m or 1 x pile diameter (whichever is greater), if relevant;
- consider the impact of weak layers underlying stiffer layers (or vice versa) on end bearing capacity; and
- reduce the pile capacity in tension to no greater than 0.8 of the pile capacity in compression.

The piling contractor must:

- make their own assessment on the suitability of their equipment to install any piles at the subject site; and
- carry out or appoint a suitably experienced contractor to test the piles in accordance with AS2159.

Where dynamic or static testing of the piles does not occur, we consider that a design geotechnical reduction factor (ϕg) of 0.4 is applicable for the pile design. If testing of the piles is proposed by the piling contractor, a higher ϕg could be adopted.

Unless otherwise stated, providing pile design parameters does not specifically indicate the driveability of any piles into soil units.

A separate driveability study may be required and must be considered by the pile designer and installer. The given pile design parameters must not be used for driveability assessments as these parameters are likely to be un-conservative.

GDR11 EARTH RETAINING STRUCTURES

GDR11.1 General

Retaining structures may be designed in accordance with AS4678 (2002) "Earth Retaining Structures". Unless otherwise specifically stated, we recommend that all retaining walls are backfilled with free-draining soil (Permeable Sand or Blue Metal Gravel as defined in Section GDR8).

Where the cohesive soil is used as retaining wall backfill, a suitable, permanent drainage system must be placed behind the wall such that a build-up of pore pressure is prevented. A separator geotextile (Bidim A24, or similar, or heavier) must be used between the interface of any granular backfill and the cohesive soil.

Where drainage is not provided, the retaining wall must be designed to accommodate water pressure behind the wall (10 kPa per metre height).

GDR11.2 Earth Pressure Coefficients and Strength Parameters

Where earth pressure coefficients are provided for retaining walls, the wall designer must make an independent assessment of the parameters appropriate to the construction method to be used, including alternative values of wall friction. Unless otherwise stated, we have assumed a horizontal ground surface behind and in front of the retaining wall for provided parameters.

GDR11.2.1 Cohesionless Soils

Where cross-referenced for suitability in the report, the following parameters may be adopted for design of earth retaining structures in cohesionless soils (sand and gravel).

Table GDR 17: Retaining Wall Geotechnical Parameters (Cohesionless Soils)

Density	γ (kN/m^3)	ϕ' (°)	k_0	Wall Friction=0		Wall Friction=0.5ϕ		Wall Friction=0.67ϕ	
				k_a	k_p	k_a	k_p	k_a	k_p
Very Loose	17	30	0.44	0.33	3.00	0.29	4.81	0.28	5.74
Loose	17	32	0.42	0.31	3.25	0.27	5.55	0.26	6.83
Medium Dense	18	34	0.39	0.28	3.54	0.25	6.47	0.23	8.26
Dense	19	36	0.36	0.26	3.85	0.22	7.63	0.21	10.18
Very Dense (1)	19	38	0.34	0.24	4.20	0.21	9.11	0.20	12.85
Very Dense (2)	19	40	0.31	0.22	4.60	0.19	11.06	0.18	16.73

NOTES:

1. *Earth pressure coefficients are provided in this table for conditions of zero friction between the wall and the soil and with wall friction of 0.5Φ' or 0.67Φ'.*
2. *A horizontal ground surface behind and in front of the wall has been assumed.*
3. *The retaining wall designer should make an independent assessment of the parameters appropriate to the construction method to be used, including alternative values of wall friction.*
4. *γ – bulk unit weight*
   ϕ' – effective friction angle
   k_a – coefficient of active earth pressure (Coulomb – AS4678-2002, Appendix E)
   k_p – coefficient of passive earth pressure (Coulomb – AS4678-2002, Appendix E)
   k_0 – coefficient of at-rest earth pressure (Jaky)
5. *Maximum fines content 12% for applicability of this table for design purposes.*
6. *Unit weights based on Table D1 of AS4678-2002, for moist bulk weight.*
7. *Friction angle based on Equation D1 and Table D2 of AS4678-2002, based on rounded, moderately graded siliceous sand.*

GDR11.2.2 Cohesive Soils

Where cohesive soils (i.e. clayey or silty soils) are proposed for backfill, geotechnical design parameters may be provided in the form of effective strength and undrained strength parameters. We note that:

- Undrained strength parameters should be used for analysis of short-term stability, or stability under sudden loading of cohesive soils.
- The effective strength parameters should be used for analysis of free-draining soils and the long-term stability of cohesive soils.

Table GDR 18: Retaining Wall Geotechnical Design Parameters (Cohesive Soils – Undrained)

Consistency	γ_b (kN/m^3)	c_u (kPa)

Soft	17	12
Firm	18	25
Stiff	19	50
Very Stiff	20	100
Hard	20	200

NOTES:
1. *γ_b – bulk unit weight*
   c_u – undrained cohesion
   $\phi_u = 0^o$ (undrained friction angle)
2. *Unit weights based on Table D1 of AS4678-2002*
3. *Undrained cohesion based on lower end of shear strengths as define in AS1726-2017, Table 11*

Table GDR 19: Retaining Wall Geotechnical Design Parameters (Cohesive Soils – Drained)

Fines Content	PI (%)	γ_b (kN/m^3)	ϕ' (°)	c' (kPa)[5]
12-35%	All	19	32	0
>35%	10	20	30	0 – 5
>35%	20	20	26	0 – 5
>35%	30	20	23	0 – 5
>35%	40	20	21	0 – 5

NOTES:
1. *γ_b – bulk unit weight*
   c' – drained cohesion
   ϕ' – effective friction angle
   PI – plasticity index
2. *Unit weights based on Table D1 of AS4678-2002, assuming generally stiff to hard overconsolidated soils.*
3. *For fines contents <35% (silty sand and clayey sand), strength parameters based on:*
   - *Lehane, B. et al (2007) "A Laboratory Investigation of the Upper Horizons of the Perth/Guildford Formation in Perth CBD", Australian Geomechanics Vol 42. No. 3.*
4. *For fines content >35% (sandy clay), strength parameters based on:*
   - *CIVL5503 course notes (2004), "Underground Construction", University of Western Australia*
5. *c' = 0 recommended for long-term design. Table D4 of AS4678 suggests c' up to 5 kPa for 'poor' fine grained soils and 10 kPa for 'average' fine-grained soils. The use of c' for design is subject to the designer's judgement but recommended by us only for temporary works.*

Per AS4678-2002 Appendix E, horizontal earth pressures for frictional-cohesive soils may be calculated in accordance with the Rankine-Bell design model (illustrated in Figure E2 of AS4678). The earth pressures are as follows (Z = depth, all other terms have the meanings given in the above tables):

- Active: $p_a = \gamma\ Z\ tan^2\left(45 - \frac{\emptyset}{2}\right) - 2\ c\ tan\left(45 - \frac{\emptyset}{2}\right)$
- Passive: $p_p = \gamma\ Z\ tan^2\left(45 + \frac{\emptyset}{2}\right) + 2\ c\ tan\left(45 + \frac{\emptyset}{2}\right)$

GDR11.3 Design and Construction Considerations

Compaction plant can augment the lateral earth pressure acting on retaining walls. Hand operated compaction equipment is recommended within 2 m of any retaining walls to minimise compaction pressures.

Retaining walls can move and rotate under imposed soil loading resulting in settlement behind the wall. This must be considered in the design and during construction of the retaining walls in order that adjacent infrastructure is not adversely affected.

It is important to note that some ground movement will occur behind any soil retaining system, including gravity retaining walls.

GDR12 EXCAVATIONS, BATTERS AND SLOPES

GDR12.1 Excavatability

Our assessment of the excavatability of rock is based on a combination of:

- Our experience on earthworks and construction projects across Australia; and

- Figure 10 of the revised graphical method of assessing excavatability of rock by:
- Pettifer, G.S. & Fookes, P.G., "A revision of the graphical method for assessing the excavatability of rock", Quarterly Journal of Engineering Geology, 27, pp145-164, 1994.

GDR12.2 Safety

All excavations must be carried out in accordance with:

- Commission for Occupational Safety and Health (2022). "Excavation: Code of Practice", Department of Mines, Industry Regulation and Safety, 89pp, Perth.

Excavations in cohesionless soils are particularly prone to instability unless support is provided. Care must be exercised in such excavations and appropriate safety measures adopted where necessary, particularly in the vicinity of existing buildings, structures and infrastructure.

The toe of any batter must be at least 500 mm above groundwater (including perched groundwater).

Unless a specific slope stability assessment or retention design has been done, the toe of any excavation should not encroach within a line of 1V:3H to any nearby footings, pavements or other settlement-sensitive structures.

Surcharges (such as structures, plant and soil stockpiles) must not be placed at or close to the crest of unsupported excavations, without a specific slope stability assessment.

A geotechnical engineer must be consulted where there is any doubt regarding the stability or safety of unsupported excavations.

GDR12.3 Batters

Temporary batter slopes provided in the report are subject to the following conditions, unless otherwise stated:

- The maximum slope height is 2 m without specific advice and slope stability analysis.
- The groundwater level for the duration of the excavation must be at least 500 mm below the toe of the slope.
- No surcharges are present in the vicinity of the slope (i.e. must be outside a line of 1V:3H from the toe of the slope).

Unless noted specifically in the report, the following batters may be adopted (maximum height: 2 m):

Table GDR 20: Default Batter Angles

Situation	Material	Batter
Temporary	Cohesionless Soils (Sand/Gravel)	1V:2H
Temporary	Cohesive Soils – Soft	1V:2H
Temporary	Cohesive Soils – Firm, Stiff, Very Stiff or Hard	1V:1H
Temporary	Limestone – Variably Cemented	1V:1H
Temporary	Limestone – Well Cemented	1V:0.5H
Permanent	All Soils	1V:3H
Permanent	Limestone – Variably Cemented	1V:2H
Permanent	Limestone – Well Cemented	1V:1H

Where specified batters cannot be accommodated in the vicinity of existing footings, roads and services, temporary or permanent lateral support will be required.

Specific advice is required for batters higher than 2 m.

Erosion control must be considered for permanent slopes.

Rock slopes must be inspected, and all loose cobbles / boulders removed. Permanent rock slopes may require dentition works or possibly rock catch drains.

GDR12.4 Grouting

Permeation or jet grouting involves injecting a microfine cement into soil to form a grouted soil block (soilcrete) to support excavation and structures. Grouting is typically only effective where the soil has the capacity to "take" the grout and form a uniformly cemented soil mass. Permeation grouting is generally limited to relatively permeable, coarse-grained cohesionless soils (sands and gravels with <5% fines).

If grouting is proposed, we recommend the following:

- Grouting must be carried out by a suitably experienced contractor.
- Only microfine cement grout should be used (not GP or coarse cement blends) to ensure adequate penetration into the soil matrix.
- Grouting should be done on a grid of not greater than 300 m.
- Application rates must be discussed with the contractor.
- The grouted soil mass must have intimate contact with any structures it is intended to support.
- The contractor must satisfy themselves that the proposed grouting can be installed with their equipment and into the subsurface conditions encountered at the site, considering possible obstructions, groundwater, cemented layers, loose sands etc.
- Testing of the grouted soil mass must be done to ensure that the grout has adequately permeated through the soil matrix. This can be done by drilling into the soil mass to ensure the cementation is continuous.

Grouting is most effective on permeable, relatively loose natural sand. Where historical filling or other ground disturbances have occurred, the grouting process can be less effective due to the tendency of grout (or other liquids) to follow more permeable paths / zones through the disturbed soil.

GDR13 STORMWATER DISPOSAL AND DRAINAGE DESIGN

GDR13.1 Groundwater Separation – Controlled Groundwater

These recommendations ONLY apply to where regional controls on groundwater (primarily: subsoil drainage, but also surficial 'main drains') exist, i.e. only to areas where groundwater is actively controlled.

The following reference:

- IPWEA (2016), "Specification: Separation Distances for Groundwater Controlled Urban Development", Institute of Public Works Engineering Australasia

recommends the following separation distances from drainage infrastructure to groundwater:

- Underground infiltration systems: 0 mm from the 50% AEP (annual exceedance probability) phreatic surface.
- Surface infiltration systems (vegetated): 300 mm from the 50% AEP phreatic surface.

The above IPWEA reference also states that performance measures for underground infiltration systems are to have a: demonstration of acceptable volumetric capacity when groundwater is elevated above base of system and that the groundwater recedes below the invert of the system during mosquito breeding seasons (grated or partially open systems).

GDR13.2 Groundwater Separation – Uncontrolled Groundwater

These recommendations apply where regional controls on groundwater levels are not present. For infiltration into soakwells and soakage basins to be the full theoretical value, an adequate separation to groundwater must be achieved, because otherwise performance is hindered by inadequate separation to groundwater or partial submergence of the infiltrative element.

We recommend a minimum separation of 500 mm from the underside of infiltrative elements to maximum groundwater level.

- To average annual maximum groundwater level (AAMGL), where this has been defined for the site; or
- To historical maximum groundwater level, where this has been defined to the site.

GDR13.3 Design Hydraulic Conductivity Values

Where provided, the values of hydraulic conductivity (k) should be considered the maximum/upper limit design values. As discussed in Section GDR3.7, the inverse auger hole test is an unsaturated field test carried out above the groundwater table and, as such, presents the best-case conditions for drainage.

For soak wells in sand, we provide the design value taking into consideration the variability in materials and reduced permeability as a result of:

- Densification of sand during site preparation works; and
- Natural variation in sands.

Design k_{unsat} values provided for soak wells are only appropriate for the design of unsaturated soils where the base of disposal area is at least 500 mm above groundwater and 500 mm above any impermeable layer.

Where design values of k_{unsat} have been provided, clogging of the base of the soakwell / drainage basin has not been considered. Clogging will need to be controlled with maintenance over the life of the soakwell / drainage basin.

For the design of subsoil drains or modelling of saturated soil performance, a k_{sat} value must be given (in the report text) or assessed by laboratory testing (or a combination of field and laboratory testing). Unless specifically stated, k_{unsat} values presented in our report are for unsaturated conditions and intended for design of stormwater disposal elements above groundwater. If no k_{sat} value has been provided, do not use the provided k_{unsat} value for saturated drainage design. Please contact us for further advice.

For saturated or semi-saturated sands, the hydraulic conductivity must be assessed by testing of representative soil samples at a NATA accredited laboratory to determine:

- The modified maximum dry density (MMDD); and
- The constant-head permeability (AS1289.6.7.1) on a sample remoulded to at least 5% greater than the proposed specification density (i.e., sample should be remoulded to 100% MMDD if the earthworks specification requires a density ratio of 95% MMDD).

For saturated or semi-saturated clayey or silty soils, the hydraulic conductivity must be assessed by testing of representative soil samples at a NATA accredited laboratory to determine:

- The standard maximum dry density (SMDD); and
- The falling-head permeability (AS1289.6.7.2) on a sample remoulded to at least 3% greater than the proposed specification density (i.e., sample should be remoulded to 101% SMDD if the earthworks specification requires a density ratio of 98% SMDD).

GDR13.4 Soakwells

In uncontrolled groundwater environments, the base of any soakwell must be the higher of:

- At least 500 mm above the average annual maximum groundwater level (AAMGL).
- At least 500 mm above any low permeability/impermeable layers (clay, rock or otherwise).

In controlled groundwater environments (refer to Section GDR13.1), the base of any soakwell may be 0 mm above the controlled groundwater level at the location of the soakwell (as determined by the civil engineer).

Soak wells must be placed outside a line of 1V:2H extending below the edge of the nearest footing, subject to local council regulations. Discharge from soak wells has been known to promote densification of loose sandy soils, leading to settlements of footings and slabs. Soak wells should be carefully wrapped with geotextile to prevent migration of sand and fines into the soak well.

Where soak wells are proposed to dispose of water within a line of 1V:2H from any basement walls or similar, the walls must be waterproofed to prevent seepage or damp within the basement wall.

In potentially karstic terrain or areas of potentially collapsible soils, soakwells should typically be located 10 m from the nearest footing, slab or pavement.

GDR13.5 Design Groundwater Elevation

Where applicable, a recommended design groundwater elevation will be provided in the report and will be identified as such.

In the absence of a specific statement on design groundwater elevation, do not assume that:

- Absence of comments about groundwater indicates an absence of groundwater (in particular, sites that are dry in the dry season to the investigated depth may well become waterlogged in the rainy season).
- Where groundwater depths/levels are noted, that these are fixed (groundwater fluctuations occur over the course of the year and between wetter and drier years).

Where groundwater elevations are likely to be critical for a development (particularly where large-scale subdivision or large developments are proposed with substantial channelling of stormwater into on-site disposal by infiltration), a site-specific hydrology study is likely to be required to confirm design groundwater elevations.

GDR14 DRAINAGE CONTROL

In addition to the site preparation measures outlined for cohesive soils (refer Section GDR6.2.4), careful control of surface water and stormwater is essential to minimise the likelihood of cohesive soils decreasing in strength and affecting the installed infrastructure. These measures include:

- The ground surface of clayey soils should be graded to drain any seepage away from structures and prevent standing water over the cohesive soils. A grade of at least 1% is recommended.
- Pavements should be sealed to minimise water ingress.
- Stormwater disposal swales should be located at least 10 m away from buildings, retaining walls and pavements.
- Runoff from hardstandings and pavements must either be collected and discharged via pipes into discrete locations (via swales or soakage basins) at least 10 m away from structures and pavements or, alternatively, discharged over a wide area, but not allowed to collect and discharge into concentrated areas, particularly near structures and pavements.
- Spoon drains should be used to collect water at the crest of slopes to capture surface runoff and direct it away from running directly down slopes or seeping into the ground behind slopes.

These measures are general in nature only and do not take into account the civil design objectives, which must be addressed separately by the civil designer.

GDR15 DEWATERING

Dewatering may be required for excavations and construction below groundwater or perched groundwater tables. Common dewatering methods are summarised below:

Table GDR 21: Dewatering Recommendations

Material	Recommended Methods
Sandy Soils	Spears Deep Well Point
Impermeable Clay	Sump Pumping

Dewatering spears are typically suitable for small scale excavations below groundwater, with a typical recommendation for spears to be installed at 1 m below the base of any excavation. Dewatering spears may not be suitable where there are impermeable/cemented/strong transition layers, i.e., it may not be possible to extract water near an impermeable layer (rock/clay), or the spear may not be readily driven through a hard clay/cemented layer (i.e., coffee rock).

Sump pumping can be done by grading a clayey excavation to drain (i.e., by using spoon drains), and excavating a sump in the excavation. A sump can typically be backfilled with a blue metal gravel, with a pump wrapped in a geofabric (i.e., Bidim A14 or similar), with disposal of water away from the excavation.

Deep well point dewatering is typically suitable for larger excavations, where there are transitional layers or where the aquifer is confined. It may not be suitable where there are impermeable layers within the profile. It involves the installation of a deep filtered well to a depth required to draw down the groundwater level at the entire site. A deep well dewatering system must be designed by a suitable designer to provide design flow rates, draw down depths etc.

GDR16 PAVEMENT SUBGRADES

Unless otherwise specified, the provided subgrade California bearing ratio (CBR) is not a pavement design, but an assessment of the subgrade as an input into any required pavement designs.

Provided design values are based on the assumption that the relevant site preparation measures are completed for all pavement subgrades, including the use of appropriate approved fill and adequate compaction. We highlight that specific requirements such as those outlined by Main Roads WA (MRWA) or the local council in their construction specifications may have different requirements.

The provided design value is based on laboratory testing (where done), local experience, and the advice as outlined in:

- Main Roads Western Australia (2013). “Engineering Road Note 9 – Procedure for the Design of Road Pavements”. Western Australia Supplement to the Austroads Guide to Pavement Technology Part 2: Pavement Structural Design, East Perth.

Where the subgrade differs from that described in the text, the subgrade CBR must be confirmed.

The performance of any pavement is highly dependent on the surface and subsurface drainage provided (also considering factors like capillary rise from seasonally high groundwater tables). Adequate drainage must be provided to any pavements, and capillary rise must be considered by the designer.

GDR17 SOIL CORROSIVITY AND AGGRESSIVITY

The relevant exposure classifications for concrete and steel piles in soils based on the exposure conditions are presented in Table GDR 22 and Table GDR 23 respectively.

The relevant exposure classifications for concrete in sulfate soils based on the exposure conditions are presented in Table GDR 24.

Table GDR 22: Exposure Classification for Concrete Piles in Soil

Exposure Conditions				Exposure Classification	
Sulfates (expressed as SO_4)[1]					
In Soil (ppm)	In Groundwater (ppm)	pH	Chlorides in Groundwater (ppm)	Soil Conditions A[2]	Soil Conditions B[3]
< 5,000	< 1,000	> 5.5	<6000	Mild	Non-aggressive
5,000 – 10,000	1,000 – 3,000	4.5 – 5.5	6,000-12,000	Moderate	Mild
10, 000 – 20,000	3,000 – 10,000	4 – 4.5	12,000-30,000	Severe	Moderate
> 20,000	> 10,000	< 4	>30,000	Very Severe	Severe

NOTES:
1. *Approximately 100 ppm SO_4 = 80 ppm SO_3*
2. *Soil Conditions A – high permeability soils (e.g. sands and gravels) which are in groundwater*
3. *Soil Conditions B – low permeability soils (e.g. silts and clays) or all soils above groundwater*
4. *Table reproduced from Table 6.4.2(C) of AS2159-2009*

Table GDR 23: Exposure Classification for Steel Piles in Soil

pH	Chlorides		Resistivity (ohm.cm)	Exposure Classification	
	In Soil (ppm)	In Water (ppm)		Soil Conditions A[2]	Soil Conditions B[3]
> 5	< 5,000	< 1,000	> 5,000	Non-aggressive	Non-aggressive
4–5	5,000-20,000	1,000–10,000	2,000 – 5,000	Mildly aggressive	Non-aggressive
3–4	20,000-50,000	10,000–20,000	1,000 – 2,000	Moderately aggressive	Mildly aggressive
< 3	> 50,000	> 20,000	< 1,000	Severely aggressive	Moderately aggressive

NOTES:
1. *1 ppm (parts per million) is equivalent to 1 mg/kg*
2. *Soil Conditions A – high permeability soils (e.g. sands and gravels) which are in groundwater*
3. *Soil Conditions B – low permeability soils (e.g. silts and clays) or all soils above groundwater*
4. *Table reproduced from Table 6.5.2(C) of AS2159-2009*

Table GDR 24: Exposure Classification for Concrete in Sulfate Soils

Exposure Conditions			Exposure Classification	
Sulfates (expressed as SO_4)[1]				
In Soil (ppm)	In Groundwater (ppm)	pH	Soil Conditions A[2]	Soil Conditions B[3]
< 5,000	< 1,000	> 5.5	Mild	Non-aggressive
5,000 – 10,000	1,000 – 3,000	4.5 – 5.5	Moderate	Mild
10, 000 – 20,000	3,000 – 10,000	4 – 4.5	Severe	Moderate
> 20,000	> 10,000	< 4	Very Severe	Severe

NOTES:
1. *Approximately 100 ppm SO_4 = 80 ppm SO_3*
2. *Soil Conditions A – high permeability soils (e.g. sands and gravels) which are in groundwater*
3. *Soil Conditions B – low permeability soils (e.g. silts and clays) or all soils above groundwater*
4. *For disturbed soils, the assumption of soil A conditions where accelerated corrosion is possible should be considered.*
5. *Table reproduced from Table 4.8.1 of AS3600-2018*

GDR18 LIQUEFACTION

Soil liquefaction can occur when loose, granular, Holocene age material below the groundwater table is subjected to a seismic event (typically within 15 m of the ground surface). This can cause a loss of strength and result in vertical and lateral movements of the site surface.

Where a liquefaction analysis is carried out and outlined in the report, this has been done in accordance with consideration to the design earthquake details as presented in AS1170.4-2007:

- The hazard factor is taken from Figure 3.2 (C) and Table 3.2. The Hazard Factor (Z) for Western Australia represents the 1 in 500-year annual probability of exceedance of ground motions measured in gravity (g).
- The probability factor (k_p) is taken from Table 3.1.

Unless otherwise stated, an earthquake magnitude of 7.5 for the south-west of WA is based on research by:

- Dhu T., Sinadinovski C., Edwards M., Robinson D., Jones T., Jones A. (2004) “Earthquake Risk Assessment for Perth, Western Australia”. 13th World Conference on Earthquake Engineering, Vancouver, B.C., Canada. Paper No. 2748.

GDR19 EXPECTATIONS OF THE REPORT

The following sections have been prepared to clarify what is and is not provided in your report. It is intended to inform you of what your realistic expectations of this report should be and how to manage your risks associated with the conditions on site.

Geotechnical engineering and environmental science are less exact than other engineering and scientific disciplines. We include this information to help you understand where our responsibilities begin and end. You should read and understand this information. Please contact us if you do not understand the report or this explanation. We have extensive experience in a wide variety of projects and we can help you to manage your risk.

GDR20 THIS REPORT RELATES TO PROJECT-SPECIFIC CONDITIONS

This report was developed for a unique set of project-specific conditions to meet the needs of the nominated client. It took into account the following:

- the project objectives as we understood them and as described in this report;
- the specific site mentioned in this report; and
- the current and proposed development at the site.

It should not be used for any purpose other than that indicated in the report. You should not rely on this report if any of the following conditions apply:

- the report was not written for you;
- the report was not written for the site specific to your development;
- the report was not written for your project (including a development at the correct site but other than that listed in the report); or
- the report was written before significant changes occurred at the site (such as a development or a change in ground conditions).

You should always inform us of changes in the proposed project (including minor changes) and request an assessment of their impact.

Where we are not informed of developments relevant to your report, we cannot be held responsible or liable for problems that may arise as a consequence.

Where design is to be carried out by others using information provided by us, we recommend that we be involved in the design process by being engaged for consultation with other members of the project team. Furthermore, we recommend that we be able to review work produced by other members of the project team that relies on information provided in our report.

GDR21 DATA PROVIDED BY THIRD PARTIES

Where data is provided by third parties, it will be identified as such in our reports. We necessarily rely on the completeness and accuracy of data provided by third parties in order to draw conclusions presented in our reports. We are not responsible for omissions, incomplete or inaccurate data associated with third party data, including where we have been requested to provide advice in relation to field investigation data provided by third parties.

GDR22 SOIL LOGS

Our reports often include logs of intrusive and non-intrusive investigation techniques prepared by Galt. These logs are based on our interpretation of field data and laboratory results. The logs should only be read in conjunction with the report they were issued with and should not be re-drawn for inclusion in other documents not prepared by us.

GDR23 THIRD PARTY RELIANCE

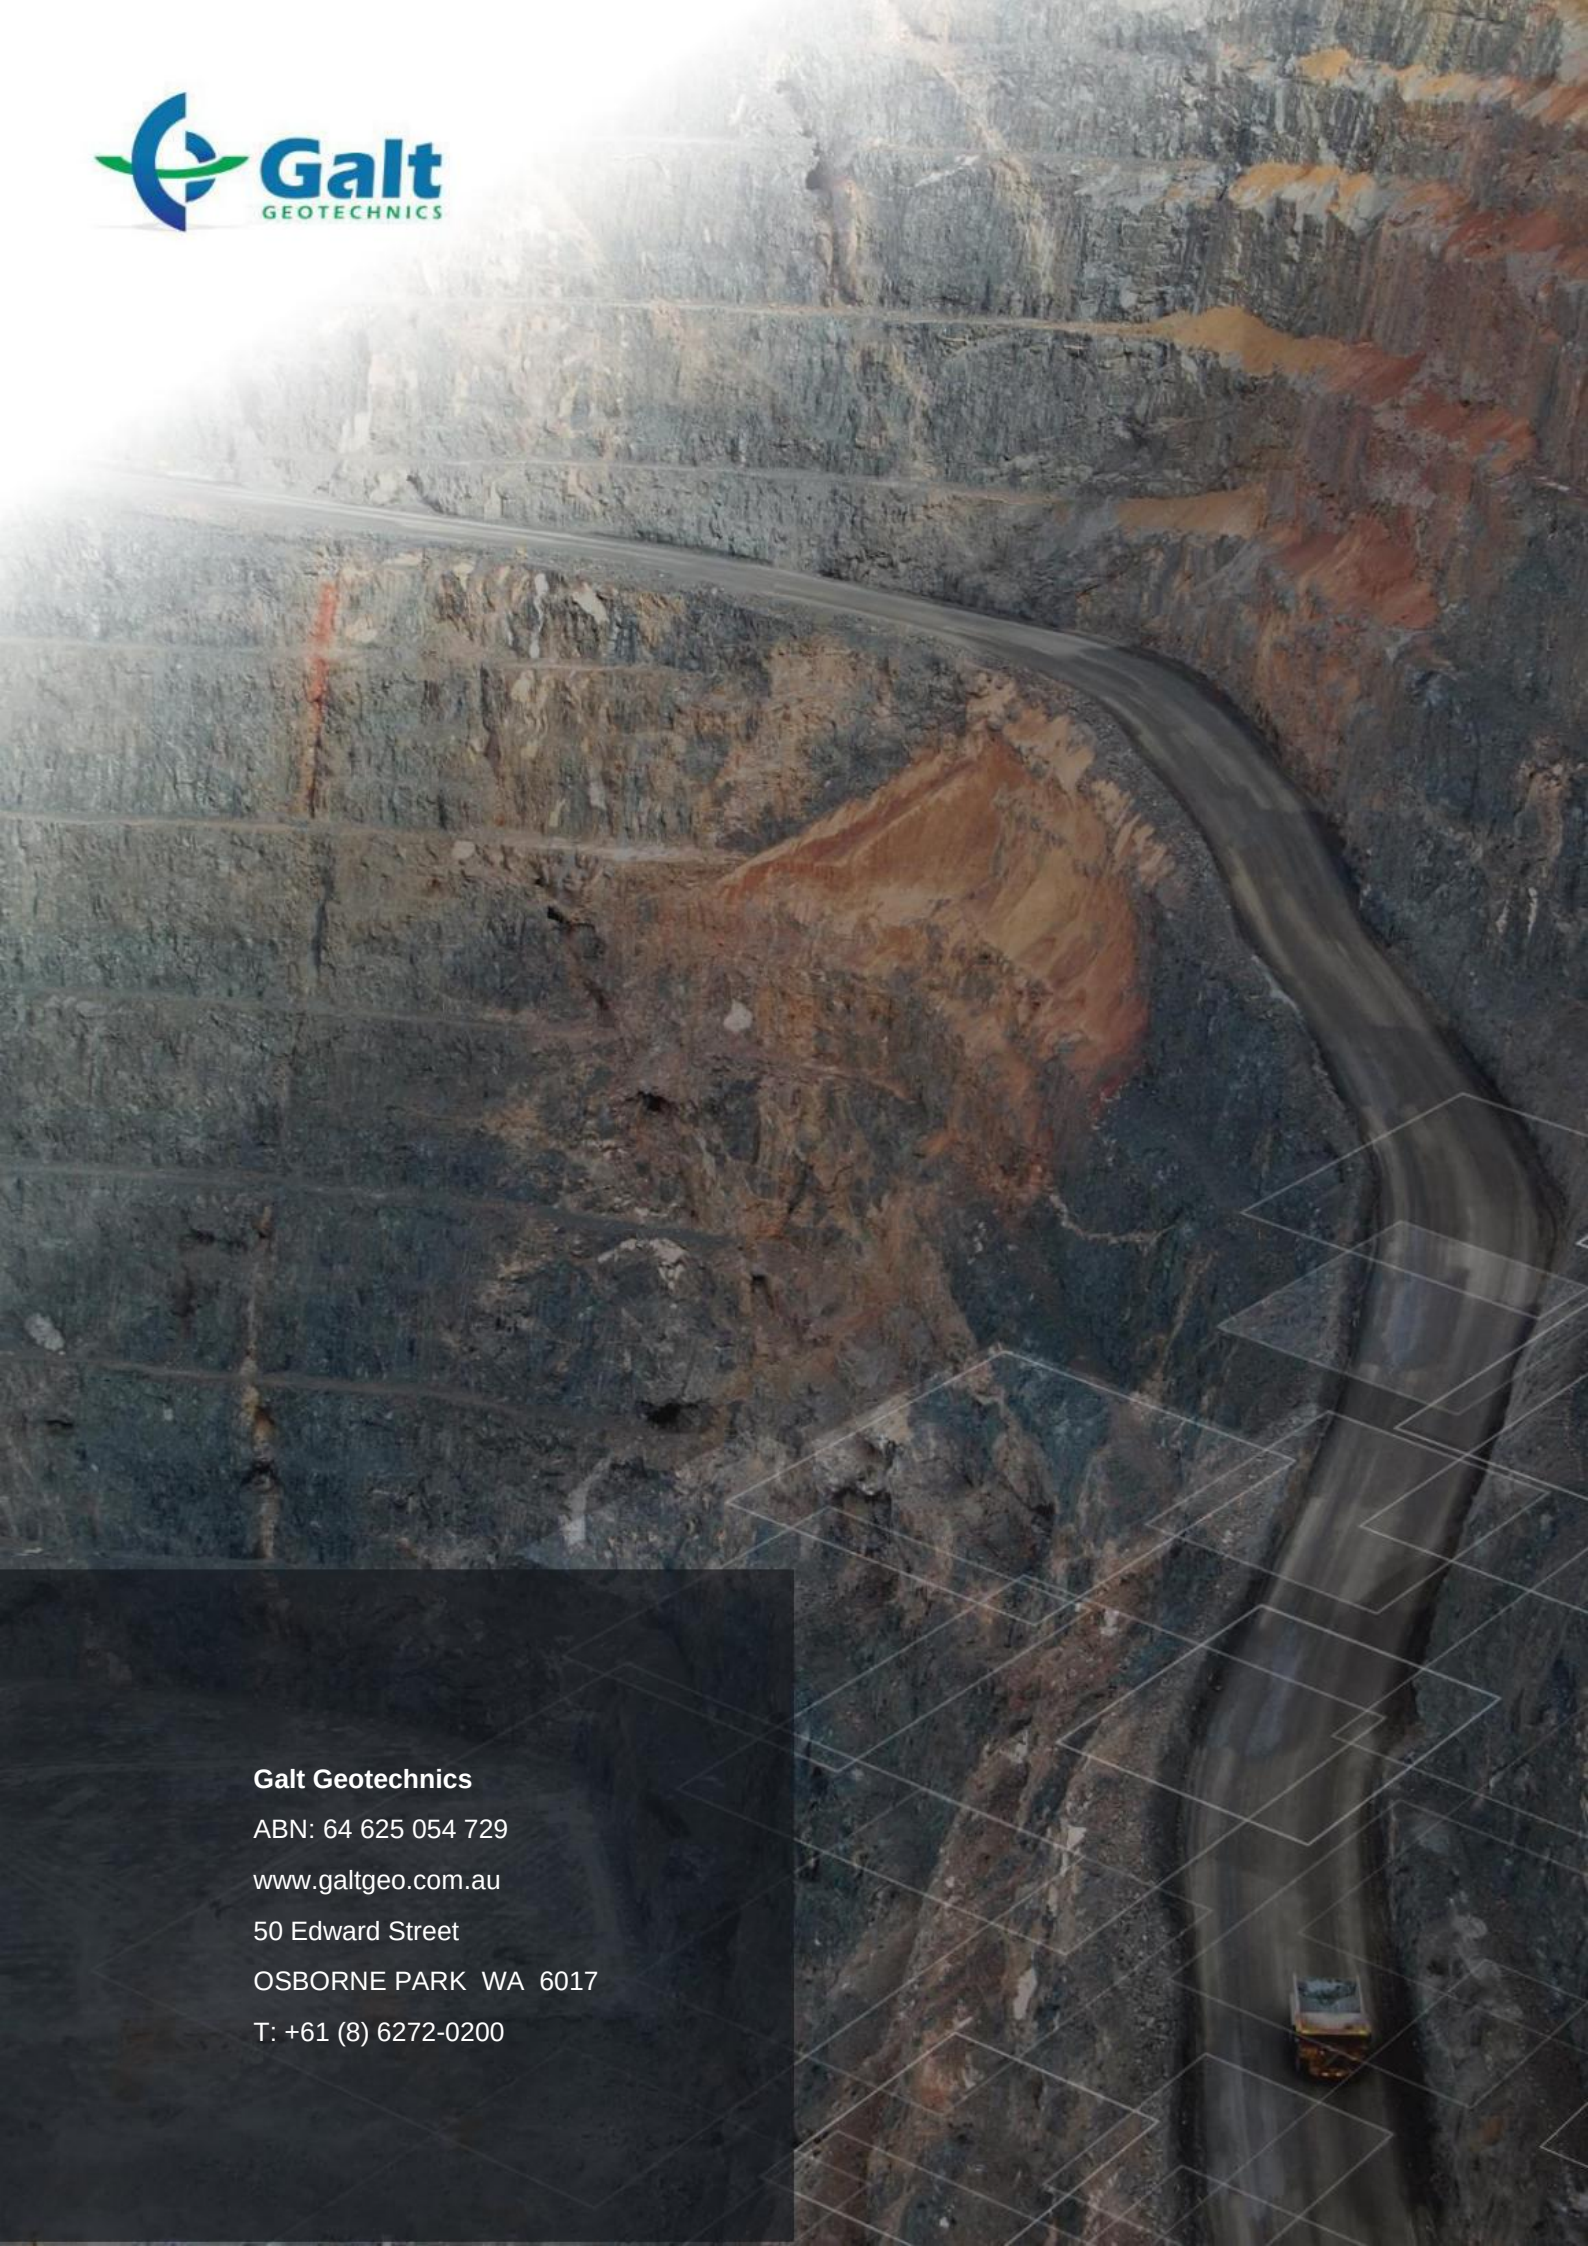
We have prepared this report for use by the client. This report must be regarded as confidential to the client and the client's professional advisors. We do not accept any responsibility for contents of this document from any party other than the nominated client. We take no responsibility for any damages suffered by a third party because of any decisions or actions they may make based on this report. Any reliance or decisions made by a third party based on this report are the responsibility of the third party and not of us.

GDR24 CHANGE IN SUBSURFACE CONDITIONS

The recommendations in this report are based on the ground conditions that existed at the time when the study was undertaken. Changes in ground conditions can occur in numerous ways including anthropogenic events (such as construction or contaminating activities on or adjacent to the site) or natural events (such as floods, groundwater fluctuations or earthquakes). We should be consulted prior to use of this report so that we can comment on its reliability. It is important to note that where ground conditions have changed, additional sampling, testing or analysis may be required to fully assess the changed conditions.

GDR25 SUBSURFACE CONDITIONS DURING CONSTRUCTION

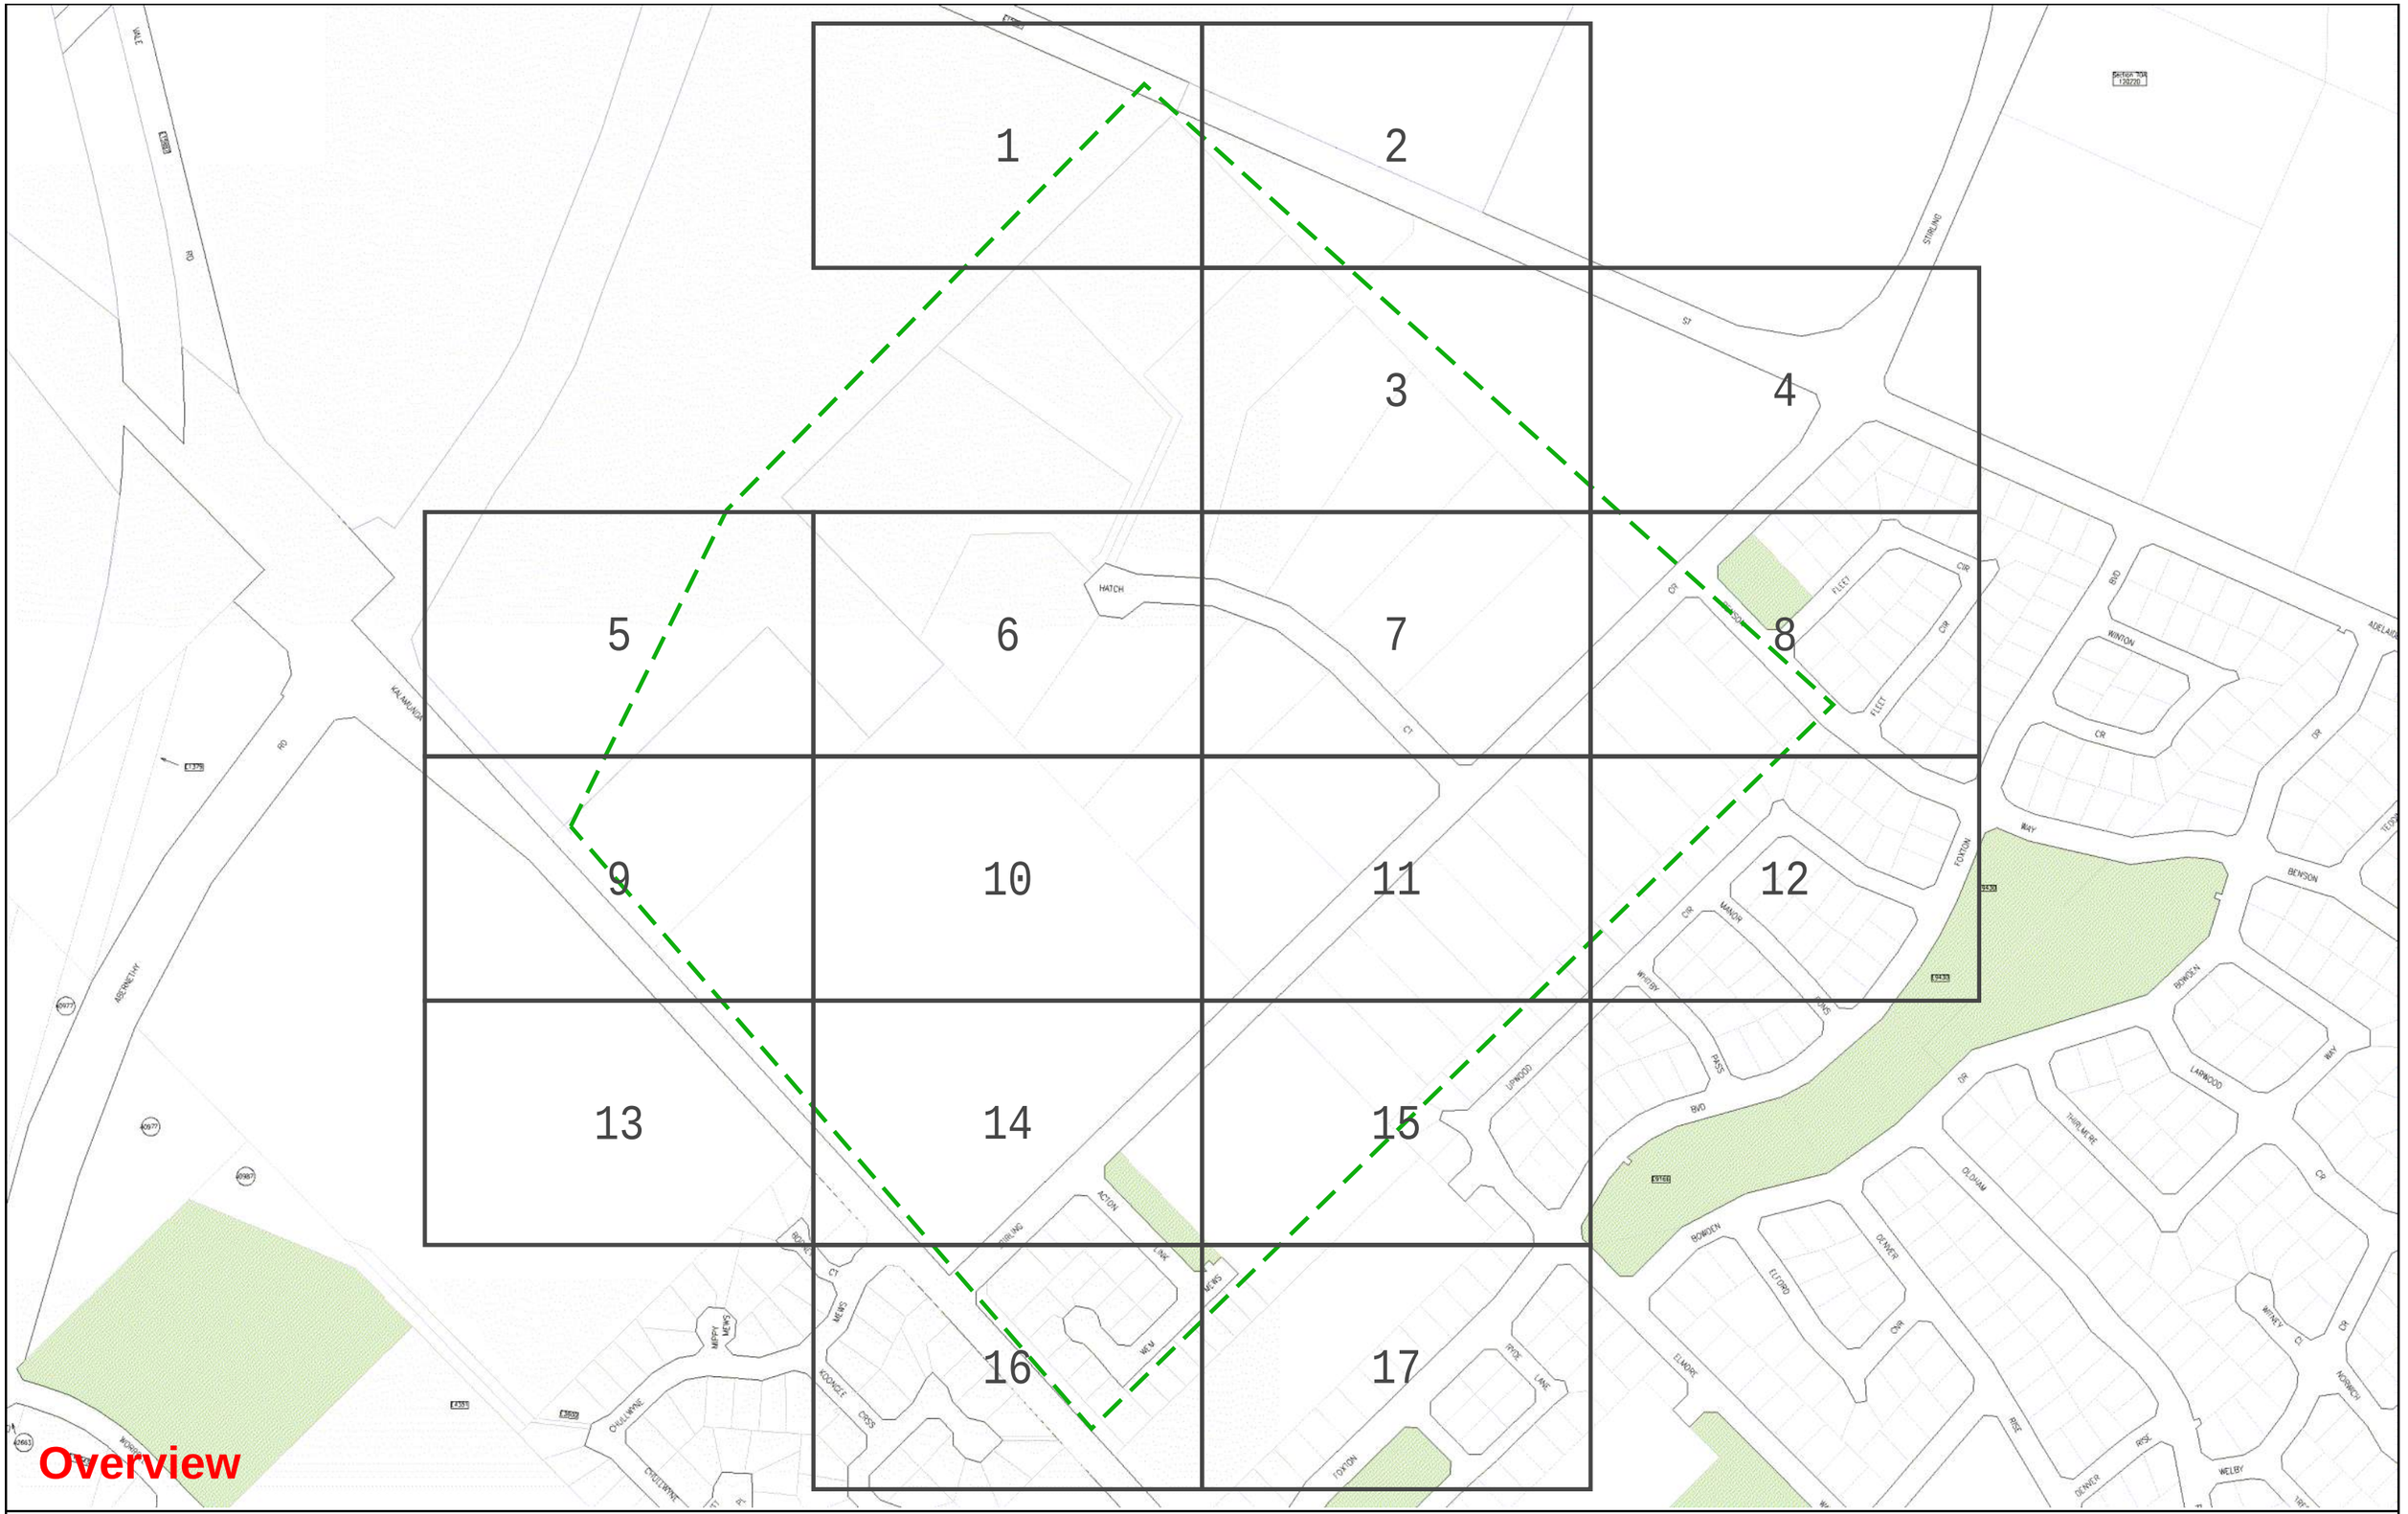
Practical constraints mean that we cannot know every minute detail about the subsurface conditions at a particular site. We use professional judgement to form an opinion about the subsurface conditions at the site. Some variation to our evaluated conditions is likely and significant variation is possible. Accordingly, our report should not be considered as final as it is developed from professional judgement and opinion.



The most effective means of dealing with unanticipated ground conditions is to engage us for construction support. We can only finalise our recommendations by observing actual subsurface conditions encountered during construction. We cannot accept liability for a report's recommendations if we cannot observe construction.

GDR26 ENVIRONMENTAL AND GEOTECHNICAL ISSUES

Unless specifically mentioned otherwise in our report, environmental considerations are not addressed in geotechnical reports. Similarly, geotechnical issues are not addressed in environmental reports. The investigation techniques used for geotechnical investigations can differ from those used for environmental investigations. It is the client's responsibility to satisfy themselves that geotechnical and environmental considerations have been taken into account for the site.



Geotechnical advice presented in a Galt Environmental report has been provided by Galt Geotechnics under a sub-contract agreement. Similarly, environmental advice presented in a Galt Geotechnics report has been provided by Galt Environmental under a sub-contract agreement.

Unless specifically noted otherwise, no parties shall draw any inferences about the applicability of the Western Australian state government landfill levy from the contents of this document.

CAUTION: Fibre optic and/ or major network present in plot area. Please read the Duty of Care and contact InfraCo Plan Services should you require any assistance.

The above plan must be viewed in conjunction with the Mains Cable Plan on the following page

WARNING
Telstra plans and location information conform to Quality Level "D" of the Australian Standard AS 5488-Classification of Subsurface Utility Information.
As such,Telstra supplied location information is indicative only.Spatial accuracy is not applicable to Quality Level D.
Refer to AS 5488 for further details. The exact position of Telstra assets can only be validated by physically exposing it.
Telstra does not warrant or hold out that its plans are accurate and accepts no responsibility for any inaccuracy.
Further on site investigation is required to validate the exact location of Telstra plant prior to commencing construction work.
A Certified Locating Organisation is an essential part of the process to validate the exact location of Telstra assets and to ensure the asset is protected during construction works.

See the Steps- Telstra Duty of Care that was provided in the email response.

1 INTRODUCTION

1.1 Location

The Hatch Court Light Industrial Area ('the site') is located in the City of Kalamunda, approximately 13km east-north-east of the Perth Central Business District (Figure 1). The site is made up of 16 lots bounded by Perth Airport Land to the north-west, Kalamunda Road to the south-west, Stirling Crescent to the south-east and Adelaide Street to the north-east (Figure 2). The site is approximately 30ha in size.

1.2 Background

The site was originally intended for residential use by rezoning to 'Urban' under the Metropolitan Region Scheme (Amendment 1187/57) in 2010. In February 2017, Council supported a request to rezone the HCLIA under subject Scheme Amendment 80 from 'Urban Development' to 'Light Industry'. It was considered that the proposed amendment would generate the need to prepare a local structure plan given previous issues raised by residents concerning traffic, access and management of the surrounding residential interface.

In January 2018, the Minster approved Scheme Amendment 80. The approval included amendments requested by the Western Australian Planning Commission (WAPC) which introduced additional site and development requirements under Clause 5.23 to the City's Local Planning Scheme No.3 (LPS3) including a Local Structure Plan.

Dynamic Planning and Developments commissioned PGV Environmental to prepare an Environmental Assessment Report (EAR) to provide an assessment of the environmental attributes of the site to assess the proposed Structure Plan (Appendix 1) to ensure that any significant environmental features of the site are considered during planning.

1.3 Scope of Works

The Environmental Assessment Report includes:

- A description of the recent and present land use including:
  - Surrounding land uses;
  - Assessment of current and historical activities on the site and surrounding areas; and
  - A search of the Department of Water and Environmental Regulation Contaminated Sites and Water Information; and
  - Heritage features.
- A description of the physical characteristics including:
  - Geology and Soils;
  - Hydrology;
  - Acid Sulphate Soil Risk Mapping.
- A description of the flora, vegetation and fauna values from the site visit and previous studies undertaken on the site;

- A wetland/creekline assessment including a site visit, mapping of wetland vegetation and determining foreshore values as per guidance including:
    - Operation Policy 4.3: *Identifying and establishing waterways foreshore areas* (DoW 2012);
    - Guidance Note 6: *Identifying and establishing waterways foreshore areas* (DoW 2013); and
    - Water Note 23: *Determining foreshore reserves* (WRC 2001).
- Implications, if any, under Western Australian policies and legislation such as the Environmental Protection Act 1986 and *Biodiversity Conservation Act 2016* and the Commonwealth *Environment Protection and Biodiversity Conservation Act 1999*.

2 LEGISLATION, POLICY AND GUIDELINES

The environmental assessment of the site has taken into consideration the following legislation, policy and guidelines and these will guide the required and expected management outcomes from the Commonwealth, State and Local government agencies.

2.1 Commonwealth Legislation

The *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) is the Australian Government's central piece of environmental legislation. It provides a legal framework to protect and manage nationally and internationally important heritage places, ecological communities, flora and fauna that are defined in the Act as Matters of National Environmental Significance (MNES).

The Environmental Assessment identifies any MNES that may be impacted by development on the site. There is some habitat for listed species of Black Cockatoos in the Structure Plan Area. Impacts on Black Cockatoo habitat will be quantified.

2.2 State Legislation

2.2.1 *Environmental Protection Act 1986*

The *Environmental Protection Act 1986* (EP Act) is administered by the Department of Water and Environment Regulation (DWER). The Act provides for conservation, preservation, protection, enhancement and management of the environment and for matters incidental to or connected with it. The Act establishes head powers to provide mechanisms for the development of Environmental Protection Policies (EPP), the referral and assessment of proposals, the control of pollution and enforcement.

The Act also provides for an Environmental Protection Authority (EPA) that is a statutory authority and is the primary provider of independent environmental advice to Government (Environmental Protection Authority, 2024). The EPA is assisted by the Office of the EPA that forms part of DWER.

The EP Act has several Parts that are particularly relevant to the proposed Light Industrial development.

Clearing Permit

The EP Act regulates the clearing of native vegetation under Part V, Division 2 (sections 51A–51T). Under the EP Act, clearing of native vegetation requires a permit from DWER unless there is an exemption under the *Environmental Protection (Clearing of Native Vegetation) Regulations 2004*. Proposals that have approval by means of a subdivision are exempt from requiring a clearing permit to clear native vegetation if implementing the subdivision in accordance with the subdivision conditions requires the clearing of native vegetation.

Works Approval

Works approvals in Western Australia are regulated under Part V, Division 3 of the Environmental Protection Act 1986 (EP Act). This section mandates that construction or modification of prescribed

premises, which have the potential to cause pollution or emissions, requires a works approval before work commences. Individual development may require approval under this party of the EP Act.

2.2.2 *Biodiversity Conservation Act 2016*

The *Biodiversity Conservation Act 2016* (BC Act) protects all native species and threatened ecological communities The BC Act recognises that activities involving the taking of flora or fauna (other than threatened species) and the disturbing of fauna (including threatened species) that are approved under the EP Act do not require further approval under the BC Act, if they are undertaken in accordance with any biodiversity conservation conditions that are applied to an authorisation. These activities include clearing of native vegetation done in accordance with an implementation decision under Part IV of the EP Act.

2.2.3 *Contaminated Sites Act 2003*

The *Contaminated Sites Act 2003* (WA) is legislation that establishes a framework for identifying, reporting, classifying, and remediating land contaminated by hazardous substances above background levels in Western Australia. It forces responsible parties (polluters or owners) to manage risks to human health and the environment.

2.2.4 *Aboriginal Heritage Act 1972*

The *Aboriginal Heritage Act 1972* (AH Act) protects all Aboriginal sites whether or not they are known and registered under the AH Act.

If any artefacts or other heritage values are discovered during preliminary searches consultation, clearing or construction works they will be required to be managed according to the AH Act.

2.3 State Policy and Guidance

2.3.1 State Planning Policy No. 2.8 Bushland Policy for the Perth Metropolitan Region

State Planning Policy No. 2.8 Bushland Policy for the Perth Metropolitan Region (SPP 2.8) (Government of Western Australia, 2010) in conjunction with Bush Forever (Government of Western Australia, 2000) seeks to ensure the protection of at least 10 per cent of the original extent of each vegetation complex within the Perth Metropolitan Region. SPP 2.8 was developed to ensure that bushland protection and management issues are appropriately addressed and integrated as a part of future land use. Bush Forever identified approximately 51,200 hectares of regionally significant vegetation for retention. The management of these areas include reservation and acquisition by the State government, negotiated planning solutions with owners who are seeking urban and/or industrial development and advice, assistance and incentive programs to support private conservation.

There is no vegetation on the site that has been identified for protection under Bush Forever and no Bush Forever sites adjacent to the site.

2.3.2 State Planning Policy No. 2.9 Water

State Planning Policy No. 2.9 *Water* (SPP 2.9) (Government of Western Australia, 2026) aims to ensure the protection and appropriate management of water resources in line with state guidelines as included within the planning framework. The broad objectives of this policy are to:

- Protect and improve the environmental and the social, cultural and economic values of the state's water resources.

- Protect public health and the long-term supply of good quality and affordable drinking water.
- Manage the risk of flooding to people, property and infrastructure.
- Ensure the secure and sustainable supply, use, disposal and re-use of water resources.
- Ensure future development is resilient to the water related impacts of climate change.
- Minimise future costs and protect public health by ensuring that appropriate wastewater infrastructure is provided.

As a part of implementing this policy, a framework guides how water resources should be considered at each stage of planning by identifying the various actions and investigations required with regard to regional and local planning strategies, town planning schemes, structure plans, subdivisions, strata subdivision and development applications as outlined in the Planning for Water Guidelines (WAPC, 2025).

2.3.3 Waterways Policy

Government policy and guidance relating to waterways foreshore areas is primarily administered by Department of Water and Environmental Regulation (DWER). A number of guidance documents assist with the determination of foreshore areas. These documents include:

- Operation Policy 4.3: *Identifying and establishing waterways foreshore areas* (DoW 2012);
- Guidance Note 6: *Identifying and establishing waterways foreshore areas* (DoW 2013); and
- Water Note 23: *Determining foreshore reserves* (WRC 2001).

2.3.4 Environmental Guidance for Planning and Development

The purpose of Environmental Protection Authority (EPA) Guidance Statement No. 33 *Environmental Guidance for Planning and Development* (EPA, 2008) is to outline the significance of environmental factors and to provide the key definitions associated with the environmental factors. Ensuring that environmental factors are considered in line with the EPA's principals and objectives and within the planning framework is what this EAR is primarily targeted at. In particular, EPA Guidance Statement No. 33 aims to:

- Provide an overview to environmental protection processes and information;
- Describe the referral and environmental impact assessment process under Part IV of the EP Act; and
- Provide the EPA's position and advice on a range of environmental factors, outlining how to protect, conserve and enhance the environmental values.

2.4 City of Kalamunda

The City of Kalamunda has a number of Local Planning Policies (LPPs) that detail the Shire's expectations with regard to managing the environment during planning and development as well as the factors that need to be considered throughout the planning process. Key LPPs and other guidelines that are applicable to the site and the environmental values within the site are outlined below:

- City of Kalamunda *Local Planning Scheme No.3* (WAPC, 2007) which requires Structure planning for the precinct to include:

1. *A structure plan is to be prepared and approved for the land pursuant to Part 4 of the deemed provisions and is to specifically address:*
   (a) Traffic management including:
      - *Provision of future vehicular access to be primarily via Adelaide Street;*
      - *Ensuring any vehicular access to Kalamunda Road does not reduce existing levels of access for adjacent properties; and*
      - *Access for lots with frontage to Stirling Crescent being provided via an internal road only.*
   (b) Appropriate interface with existing residential development along Stirling Crescent including setbacks, landscaping, fencing and façade treatment provisions;
   (c) The identification and protection of environmentally significant areas within the land through the provision of appropriate buffers; and
   (d) The identified bushfire risk in accordance with State Planning Policy 3.7 and Guidelines for Planning in Bushfire Prone Areas.
2. *Subdivision and / or development is to generally be in accordance with the approved structure plan.*

- City of Kalamunda *Local Biodiversity Strategy 2023-2030* (City of Kalamunda, 2023) which outlines the overarching management of Local Natural Areas and environmental assets in the City;
- City of Kalamunda Draft Local Planning Policy (LPP) 34 *Wetlands and Waterways* (City of Kalamunda, 2021) which outlines the planning considerations for wetlands and waterways. Relevant to the site the LPP requires the following;

3. *Waterway foreshore areas are determined by several biophysical characteristics that contribute to the health and function of the waterway ecosystem. The width of a waterway foreshore should therefore reflect the biophysical characteristics of the waterway.*
4. *Planning applications for proposals adjacent to waterways shall be accompanied by a biophysical assessment to determine an appropriate foreshore width, undertaken in accordance with the Department of Water's (now Department of Water and Environment Regulation) Operational Policy: Identifying and Establishing Waterway Foreshore Areas and the Water and Rivers Commission's (now Department of Water and Environment Regulation) Determining Foreshore Reserves.*
5. *The biophysical assessment shall be undertaken by a suitably qualified professional and shall include:*
   a) The extent, type and condition of the riparian and terrestrial native vegetation associated with or influencing the waterway.
   b) Flood prone land and areas subject to waterway channel changes, including the floodway and flood fringe.
   c) Riverine landform (topography and geomorphology).
   d) Landforms, soil types and soil characteristics that influence the extent of foreshore vegetation, erosion and the movement of nutrients and contaminants (including acid sulfate soils).
   e) Aquatic and riparian flora and fauna and their habitat.
   f) Land use compatibility.

g) *Heritage - archaeological and ethnographic sites.*

h) *Mapping of biophysical features and proposed foreshore boundary over recent aerial imagery.*

i) *Justification as to the location and extent of the proposed foreshore boundary.*

6. *In the absence of a biophysical assessment, the City may agree to a conservative foreshore width that adequately protects and enhances the hydrological, ecological, and social values of the waterway. In determining a conservative foreshore width, the City may rely on recent, high-quality aerial imagery, as well as a site visit to ensure waterway values will be adequately protected and enhanced.*

7. *The foreshore width to a waterway shall not be less than 15 m in width, measured each side of the waterway, extending outwards from the high water line.*

8. *Permissible activities or actions as part of, or as a result of, development proposals within the waterway foreshore include:*

a) *Rehabilitation of disturbed areas, including vegetation restoration, weed control and erosion control measures*

b) *Retention of all native vegetation*

c) *Passive recreation such as footpaths, where native vegetation is not adversely impacted*

d) *Conservation fencing and gates to controlled undesired access.*

Local Planning Policy 34 also provides a guideline for buffer distance to wetlands as outlined in Table 1.

Table 1: Buffer Distances as per Draft LPP 34

Category	**Wetland Management Category Objective (Hill *et al* 1996)**	**Buffer Distance (unless varied in accordance with Clause 6)**
Geomorphic Wetland-Conservation Category Wetland	To preserve wetland (natural) attributes and functions.	50 m
Geomorphic Wetland-Resource Enhancement Wetland	To restore wetlands through maintenance and enhancement of wetland functions and attributes.	30 m
Geomorphic Wetland-Multiple Use Wetland	To use, develop and manage wetlands in the context of water, town, and environmental planning.	No buffer requirement.

Source: Draft LPP 34 City of Kalamunda, 2021

- City of Kalamunda Draft Local Planning Policy (LPP) 35 *Hatch Court Light Industrial Precinct* (City of Kalamunda, 2022) which provides guidance for progressing the development potential of the site.

3 EXISTING ENVIRONMENT

3.1 Land Use

3.1.1 Historic Land Use

A review of historical aerial photography shows a mixture of dry and wet areas. The earliest aerial photography available is from 1953 (Landgate, 2025a) and shows the site has heavily cleared and disturbed probably for grazing at this early date (Plate 1). Some native vegetation remains.

Plate 1: Aerial Photograph from 1953 (Landgate, 2025a)

In aerial photography from 1985 a creekline is apparent, running from east to west through the middle of the site. A drainage channel has been constructed through the creekline (Plate 2). The 1985 photograph also show that development of the Stirling Precinct is underway as well as construction on Lot 200 Kalamunda Road.

The photograph from 1995 shows further development on the site (Plate 3). Lot 200 Kalamunda Road was fully developed for hardstand in 2023 to 2024 (Plate 4).

Plate 2: Aerial Photograph from 1985 (Landgate, 2025a)

Plate 3: Aerial Photograph from 1995 (Landgate, 2025a)

Plate 4: Aerial Photograph from 2000 (Landgate, 2025a)

The site is not a known or suspected contaminated site as listed under the *Contaminated Sites Act 2003* (DWER, 2025a). There may be small areas of contamination that may require investigation and possibly remediation prior to development.

3.1.2 Surrounding Land Use

To the north and west of the site is developed industrial land and to the south and east are residential areas and a retirement village. Ollie Worrel Reserve is approximately 300m to the south and contains breeding habitat for birds.

3.2 Heritage

3.2.1 European Heritage

Heritage sites can be listed under the following lists/registers:

- World Heritage Sites;
- National Heritage Sites;
- Commonwealth Heritage Sites;
- Sites on the register of the National Estate;
- Sites on the Western Australian Heritage Council Register; and
- Sites listed in the City of Kalamunda Municipal Heritage Inventory List.

There are no listed Heritage Sites or Interim Heritage Sites on the site (National Map, 2025; Heritage Council of Western Australia, 2025; DCCEEW, 2025).

3.2.2 Aboriginal Cultural Heritage

There is part of a listed Aboriginal Cultural Heritage Site mapped on the site, Site ID 3719 Munday Swamp (Appendix 2). There is also a lodged Aboriginal Cultural Heritage Site ID 30039, Stirling Crescent Swamp. Lodged Aboriginal Cultural Heritage Sites are mapped from information which has been received in relation to an Aboriginal cultural heritage place, but is yet to be assessed under Section 5 of the *Aboriginal Heritage Act 1972.*

3.3 Topography

The site is predominantly low lying and flat ranging from 21.15m Australian Height Datum (AHD) in the south-east, 24m AHD in the north and 22m AHD in the north-east corner (Figure 2). The site rises gently from the south-east to the north-west (Figure 2).

3.4 Geomorphology and Soils

3.4.1 Geology

The site is located on the eastern side of the Swan Coastal Plain. The Swan Coastal Plain is generally flat and is approximately 20 to 30 kilometres wide, consisting of a series of geomorphic entities running parallel to the coastline. The site is mapped as being part of the Pinjarra Plain System (DPIRD, 2025). The Pinjarra Plain has successive layering of soils formed from erosion of material from the scarp and east of the scarp (van Gool, 1999).

The Pinjarra Plain System consists of broad low relief plain west of the foothills, comprising predominantly Pleistocene fluvial sediments and some Holocene alluvium associated with major current drainage systems (Bolland, 1998). The major soils are naturally poorly drained and many swamps occur (DPIRD, 2025).

3.4.2 Soils

The soil phases mapped on the site are:

- Pinjarra, Ya2 Phase (213Pj_Ya2) is located on plain and swamp margins with deep, poorly drained, grey siliceous sand overlying clay.
- Pinjarra, Phase Gf7 (213Pj_Gf7) is located on minor rises with deep, rapidly drained brownish, siliceous or bleached sands underlain by mottled yellow clay (DPIRD, 2025).

3.4.3 Land Degradation Risks

The Land Degradation Risk Categories of the soil phases mapped on the site are outlined in Table 2.

Table 2: Land Degradation Risk Categories

Soil Type	Water Erosion	Wind Erosion	Waterlogging	Flooding	Salinity risk
Pinjarra, Ya2 Phase	<3% of map unit has a high to extreme water erosion risk	50-70% of map unit has a high to extreme wind erosion risk	>70% of map unit has a moderate to very high risk	<3% of the map unit has a moderate to high hazard	3-10% of the map unit has a moderate to high hazard

Soil Type	Water Erosion	Wind Erosion	Waterlogging	Flooding	Salinity risk
Pinjarra, Phase Gf7	<3% of map unit has a high to extreme water erosion risk	>70% of map unit has a high to extreme wind erosion risk	10-30% of map unit has a moderate to very high risk	<3% of the map unit has a moderate to high hazard	<3% of the map unit has a moderate to high hazard

In summary, all of the soils on the site have a risk of wind erosion. There is a low risk associated with the soils of water erosion or flooding and only the Pinjarra phase has a risk of waterlogging and salinity.

3.4.4 Acid Sulphate Soils

Acid sulphate soils (ASS) are wetland soils and unconsolidated sediments that contain iron sulphides which, when exposed to atmospheric oxygen in the presence of water, form sulphuric acid. ASS form in protected low energy environments such as barrier estuaries and coastal lakes and commonly occurs in low-lying coastal lands such as Holocene marine muds and sands. When disturbed, these soils are prone to produce sulphuric acid and mobilise iron, aluminium, manganese and other heavy metals. The release of these reaction products can be detrimental to biota, human health and built infrastructure.

The ASS Risk on the site has been mapped by the Department of Water and Environmental Regulation (DWER) (Landgate, 2025b) as being Moderate to Low (<3m from the surface) over most of the site (areas in orange on Plate 5). The areas associated with the wetter areas of the site are mapped as having a High to Moderate risk (<3m from the surface) (areas in red on Plate 5).

Plate 5: Acid Sulphate Soils Risk Mapping

3.5 Flora and Vegetation

3.5.1 Previous Studies

Previous studies undertaken on the site include:

- A flora and vegetation survey of Lot 200 Kalamunda Road was undertaken by ENV Australia (2009).
- A review of the flora, vegetation and wetland values of Lot 200 by Mattiske Consulting Pty Ltd (2010).
- Wetland assessment of the eastern part of the creekline (PGV Environmental, 2012);
- A vegetation appraisal for the northern section of the site in 2014 (PGV Environmental, 2014).

3.5.2 Desktop Searches

Searches of the following databases were undertaken prior to the site survey:

- DBCA Threatened and Priority Flora Databases including the WA Herbarium database (WAHerb) and Threatened (Declared Rare) and Priority Flora Species List (TFPL) (Appendix 3) (DBCA, 2025) for a radius of 10 km (Search Reference: 10-0925FL) that provides a list of Threatened and Priority species recorded in the area;
- Atlas of Living Australia (ALA, 2025) (Appendix 4) which shows all species that have been recorded within a 10km radius of the site.
- The EPBC Act Protected Matters Search Tool (DCCEEW, 2024) (Appendix 5) which identifies species that are listed under the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) that could potentially have habitat within a 5km radius of the site.
- DBCA Threatened and Priority Ecological Community Database (Appendix 6) for a radius of 10km that provides a list of Threatened and Priority ecological communities recorded in the area (DBCA, 2025b) (Search Reference: 65-0825EC).

3.5.3 Survey Methodology

A Reconnaissance Flora and Vegetation Survey of the site was undertaken by PGV on 7 July 2025 in accordance with the Environmental Protection Authority Technical Guidance: *Flora and Vegetation Surveys for Environmental Impact Assessment* (2016). The survey included a review of previous studies and a thorough site walkover.

3.5.4 Flora Database Search Results

The results of the database searches and their likelihood to occur on the site is outlined in Table 3. Many of the species identified are from the Perth Hills or claypan habitats and do not have habitat on the site.

None of the species identified have been previously recorded on the site and there are no species expected to occur on the site as there is no suitable habitat due to previous clearing of the site.

Conservation codes are in Appendix 7.

Table 5: Identified Significant Flora Species and Likelihood of Occurring on the Site

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Caladenia huegelii	King Spider-orchid, Grand Spider-orchid, Rusty Spider-orchid	Critically Endangered	Endangered	The Grand Spider-orchid prefers deep grey-white sand usually associated with the Bassendean sand-dune system, however, rare plants have been known to extend into the Spearwood system (in which calcareous yellow sands dominate) in some areas (DEC, 2009a). This species generally does not survive in disturbed areas.	Highly Unlikely – the site is on the Pinjarra Plain
Calectasia cyanea	Blue Tinsel Lily	Critically Endangered	Critically Endangered	The Blue Tinsel Lily prefers white, grey or yellow sand or gravel. This species is restricted to Torndirrup National Park and Albany region of the South West Botanical Province (Barrett and Dixon, 2001).	No – species record in error – outside of species range
Calytrix breviseta subsp. *breviseta*	Swamp Starflower	Critically Endangered	Endangered	The Swamp Starflower occurs in sandy clay in swampy flats.	Highly Unlikely – not suitable habitat
Drakaea elastica	Glossy-leafed Hammer Orchid	Critically Endangered	Endangered	The Glossy-leafed Hammer Orchid prefers low-lying situations adjoining winter-wet swamps and grows on bare patches of sand within otherwise dense vegetation in low-lying areas alongside winter-wet swamps, typically in banksia (*Banksia menziesii*, *B. attenuata* and *B. ilicifolia*) woodland or spearwood (*Kunzea glabrescens*) thicket vegetation (DEC, 2009b).	Highly Unlikely – not suitable habitat
Eremophila nivea	Silky Eremophila	Critically Endangered	Endangered	Silky Eremophila occurs on sandy clay, clay loam on undulating plains, road verges.	No – species record in error – outside of species range
Eucalyptus x balanites	Cadda Road Mallee	Critically Endangered	Endangered	The Cadda Road Mallee prefers sandy soils with lateritic gravel.	Highly Unlikely – not lateritic habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Gastrolobium hamulosum	Hook-point Poison	Critically Endangered	Endangered	Hook-point Poison prefers sandy, often gravelly soils or clay and flats, slopes, ridges.	No – species record in error from 1844 – outside of species range
Grevillea maccutcheonii	McCutcheon's Grevillea	Critically Endangered	Endangered	McCutcheon's Grevillea prefers shallow soils over laterite, clay on seasonally inundated sites near Busselton.	No – species record in error – outside of species range
Grevillea thelemanniana	Spider Net Grevillea	Critically Endangered	Critically Endangered	Spider Net Grevillea occurs on sandy clay soil in flat seasonally wet damplands and limestone soils are associated with some of the sites (TSSC, 2018).	Highly Unlikely – not suitable habitat
Hemiandra rutilans	Sargents Snakebush, Colourful Snakebush	Critically Endangered	Endangered	Sargents Snakebush grows in yellow/grey sand and was originally collected at Sand Springs, south-west of York, which is now extinct. The most recent confirmed location was south of Dowerin where it grew in low Banksia prionotes woodland with *Eremaea pauciflora*, *Nuytsia floribunda* and *Verticordia densiflora* (DEC, 2008a).	No – species record in error from 1877 – outside of species range
Ptilotus pyramidatus	Pyramid Mulla-mulla	Critically Endangered	Critically Endangered	The Pyramid Mulla-mulla in known from one location and occurs on seasonally inundated flat (floodplain) with *Melaleuca acutifolia*, *Verticordia plumosa* var. *brachyphylla*, *Hypocalymma angustifolium*, *Meeboldii cana*, *Chorizandra enodis*, rushes, sedges and species-rich native annual herbs and geophytes (DPaW, 2016).	Highly Unlikely – not suitable habitat
Thelymitra dedmaniarum	Cinnamon Sun-orchid	Critically Endangered	Endangered	Cinnamon Sun-orchid is known from only two locations in the Gidgegannup area. It is confined to open wandoo woodland on red-brown sandy loam associated with dolerite and granite outcropping (DEC, 2012).	Highly Unlikely – not suitable habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Thelymitra magnifica	Crystal Brook Star-orchid	Critically Endangered		The Crystal Brook Star-orchid occurs on stony ridges with granite outcrops (Brown et al., 2013)	Highly Unlikely – not suitable habitat
Thelymitra variegata	Queen of Sheba	Critically Endangered		The Queen of Sheba orchid grows on sandy clay, sand and laterite. The orchid is found in banksia and Jarrah woodland (Brown *et al*., 2013)	Highly Unlikely – not suitable habitat
Acacia denticulosa	Sandpaper Wattle	Endangered	Vulnerable	Sandpaper Wattle occurs in sand, loam, clay on granite outcrops, rarely on sandplains.	Highly Unlikely – not suitable habitat
Austrostipa bronweniae		Endangered	Endangered	*Austrostipa bronweniae* is recorded from wetlands seasonally waterlogged muddy sand with *Gahnia trifida*, *Actinostrobus pyramidalis*, *Grevillea thelemanniana*, *Melaleuca viminea* subsp. *viminea* (Australian National Herbarium, 2009).	Unlikely – not typical habitat
Byblis gigantea	Rainbow Plant	Endangered		The Rainbow Plant occurs in sandy-peat swamps in seasonally wet areas.	Highly Unlikely – not suitable habitat
Darwinia apiculata	Scarp Darwinia	Endangered	Endangered	The Scarp Darwinia grows in lateritic soils.	Highly Unlikely – not suitable habitat
Diplolaena andrewsii	Native Wild Rose	Endangered	Endangered	The Native Wild Rose occurs on loam, clay in association with granite outcrops and hillsides.	No – species record in error – outside of species range
Diuris drummondii	Tall Donkey Orchid	Endangered	Vulnerable	The Tall Donkey Orchid grows in low-lying depressions in peaty and sandy clay swamps (DEC, 2008), in areas that contain surface water well into summer (Brown *et al*., 2013).	Highly Unlikely – not suitable habitat
Diuris purdiei	Purdie's Donkey-orchid	Endangered	Endangered	Purdie's Donkey Orchid occurs in grey-black sand in moist winter-wet swamps with winter inundation in dense heath with scattered trees and amongst native sedges and dense heath with scattered emergent *Melaleuca preissiana*, *Corymbia calophylla*, *E. marginata* and *Nuytsia floribunda*.	Highly Unlikely – not suitable habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Drakaea micrantha	Dwarf Hammer-orchid	Endangered	Vulnerable	Dwarf Hammer-orchid usually occurs on cleared fire breaks or open sandy patches in Banksia, Jarrah and Sheoak woodlands or forest and often found under Spearwood thickets.	Unlikely – not typical habitat
Eremophila glabra subsp. *chlorella*		Endangered	Endangered	*Eremophila glabra* subsp. *chlorella* occurs in sandy clay in winter-wet depressions associated with *Casuarina obesa*, *Viminaria juncea, Melaleuca lateritia, M. acutifolia, M. rhaphiophylla, M. viminea, M. teretifolia, M. brevifolia, Chorizandra enodis, Eucalyptus wandoo, E. loxophleba*, *Acacia saligna, A. microbotrya, Banksia telmatiaea, B. nivea* subsp. *nivea*, *Regelia ciliata, Petrophile seminuda, Verticordia densiflora* var. *densiflora* and *Calothamnus hirsutus* (DPaW, 2016).	Highly Unlikely – not suitable habitat
Grevillea curviloba	Narrow curved-leaf Grevillea	Endangered	Endangered	Narrow curved-leaf Grevillea prefers sand, sandy loam in winter-wet heath.	Highly Unlikely – not suitable habitat
Lepidosperma rostratum	Beaked Lepidosperma	Endangered	Endangered	Beaked Lepidosperma is found in peaty sand, clay associated with *Banksia telmatiaea* and *Calothamnus hirsutus*.	Highly Unlikely – not suitable habitat
Macarthuria keigheryi	Keighery's Macarthuria	Endangered	Endangered	Keighery's Macarthuria prefers white or grey sand on low-lying winter-wet damp sands growing among heathland, Jarrah and Sheoak/Banksia woodland and Banksia/Eucalypt Woodland (DEC, 2008b).	Highly Unlikely – not suitable habitat
Thelymitra stellata	Star Sun-orchid	Endangered	Endangered	The Star Sun-orchid grows in gravelly loam among low heath and scrub in *Eucalyptus marginata* (Jarrah) and *E. wandoo* (Wandoo) woodland, and in low heath on lateritic hill tops.	Highly Unlikely – not suitable habitat
Trithuria occidentalis	Swan Hydatella	Endangered	Endangered	Swan Hydatella grows partly submerged on the edge of shallow, winter-wet claypans in very open shrubland of Robin Redbreast Bush (*Melaleuca lateritica*) and numerous annual herbs.	Highly Unlikely – not suitable habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Acacia anomala	Grass Wattle, Chittering Grass Wattle	Vulnerable	Vulnerable	The Grass Wattle prefers lateritic soils and slopes.	Highly Unlikely – not suitable habitat
Acacia aphylla	Leafless Rock Wattle	Vulnerable	Vulnerable	Leafless Rock Wattle occurs in sand, loam, clay loam on granite outcrops, hills.	Highly Unlikely – not suitable habitat
Andersonia gracilis	Slender Andersonia	Vulnerable	Endangered	Slender Andersonia occurs in white/grey sand, sandy clay, gravelly loam in winter-wet areas, near swamps. Vegetation type is low open heath with shrubs over sedges (DEC, 2006).	Highly Unlikely – not suitable habitat
Anigozanthos viridis subsp. *terraspectans*	Dwarf Green Kangaroo Paw	Vulnerable	Vulnerable	The Dwarf Green Kangaroo Paw occurs on grey sand, clay loam in winter-wet depressions.	No – outside of species range
Anthocercis gracilis	Slender Tailflower	Vulnerable	Vulnerable	Slender Tailflower occurs in sandy or loamy soils near granite outcrops.	Highly Unlikely – not suitable habitat
Banksia mimica	Summer Honeypot	Vulnerable	Endangered	Summer Honeypot prefers white or grey sand over laterite, sandy loam.	Highly Unlikely – not suitable habitat
Boronia adamsiana	Barbalin Boronia	Vulnerable	Vulnerable	Barbalin Boronia occurs in yellow sand/loam over laterite on flats, road verges.	No – species record in error from 1889 – outside of species range
Chamelaucium lullfitzii	Gingin Wax	Vulnerable	Endangered	Gingin wax is restricted to a very small area associated with the Gingin scarp, south of Gingin where plants grow on white, grey, or yellow sands in low open banksia woodland (Marchant, 2019).	Highly Unlikely – not suitable habitat
Conospermum undulatum	Wavy-leaved Smokebush	Vulnerable	Vulnerable	Wavy-leaved Smokebush occurs on sand and sandy clay soils, often over laterite, on flat or gently sloping sites between the Swan and Canning Rivers with a few records from slightly swampy habitat (DEC, 2009c).	Highly Unlikely – not suitable habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Diuris micrantha	Dwarf Bee-orchid	Vulnerable	Vulnerable	The Dwarf Bee-orchid is usually found on brown loamy clay in winter-wet swamps, in shallow water.	Highly Unlikely – not suitable habitat
Eleocharis keigheryi	Keighery's Eleocharis	Vulnerable	Vulnerable	Keighery's Eleocharis occurs in clay, sandy loam and is emergent in freshwater: creeks, claypans.	Highly Unlikely – not suitable habitat
Gastrolobium lehmannii	Cranbrook Pea	Vulnerable	Vulnerable	The Cranbrook Pea occurs in red clay, laterite on low hilltop of breakaway.	No – record in error – outside of species range
Grevillea flexuosa	Zig Zag Grevillea	Vulnerable	Vulnerable	Zig Zag Grevillea occurs in red-brown sand with laterite and gravel, sand over granite on ridgetop plateaus and associated breakaways.	Highly Unlikely – not suitable habitat
Morelotia australiensis (Listed as *Tetraria australiensis*)	Southern Tetraria	Vulnerable	Vulnerable	Southern Tetraria occurs in grey sand over clay; also described as yellow and sandy or clayey lateritic soils favouring winter-wet swampy depressions, drainage lines or rises surrounding swamps.	Unlikely – not typical habitat
Ptychosema pusillum	Dwarf Pea	Vulnerable	Vulnerable	Dwarf Pea occurs in sand on rises.	No – record in error – outside of species range
Ricinocarpos trichophorus	Barrens Wedding Bush	Vulnerable	Endangered	Barrens Wedding Bush grows in sandy clay, loam on breakaways, among sandstone rocks.	No – record in error – outside of species range
Amanita quenda	Quenda lepidella	Priority 1		Quenda lepidella are solitary or scattered, in moist sandy soil in wetland vegetation (Davidson *et al*., 2015).	Unlikely – not typical habitat
Bolboschoenus fluviatilis	River Bulrush	Priority 1		River Bulrush occurs on the margins of wetlands and rivers.	Unlikely – not typical habitat
Boronia humifusa		Priority 1		*Boronia humifusa* grows in gravelly clay loam over laterite in Jarrah-marri open forest.	Highly Unlikely – not suitable habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Calandrinia sp. Bayswater (C. Andrews s.n. 11/1902)		Priority 1		*Calandrinia* sp. Bayswater is known from Bayswater growing in grey sand over sand.	Highly Unlikely – not suitable habitat
Drosera paleacea	Dwarf Sundew	Priority 1		Dwarf Sundew occurs in white sand, sandy clay.	No – record in error – occurs near Albany
Drosera patens		Priority 1		*Drosera patens* occurs in sandy soils on the margins of winter-wet depressions, swamps and lakes.	Unlikely – not typical habitat
Drosera x sidjamesii		Priority 1		*Drosera x sidjamesii* grows in peaty sand along lake margins, close to winter high-water line.	Highly Unlikely – not suitable habitat
Hydrocotyle striata		Priority 1		*Hydrocotyle striata* occurs in clay near springs.	Highly Unlikely – not suitable habitat
Korthalsella leucothrix	Jointed Mistletoe	Priority 1		Jointed Mistletoe occurs on *Acacia acuminata* and *A. craspedocarpa*.	No – record in error – outside of species range
Levenhookia preissii	Preiss's Stylewort	Priority 1		Preiss's Stylewort occurs in grey or black peaty sands in swamps.	Highly Unlikely – not suitable habitat
Senecio gilbertii		Priority 1		Senecio gilbertii grows in peaty sand near swamps on slopes.	Highly Unlikely – not suitable habitat
Acacia benthamii		Priority 2		*Acacia benthamii* grows on sand, typically on limestone breakaways	Highly Unlikely – not limestone habitat
Calectasia grandiflora	Blue Tinsel Lily	Priority 2		Blue Tinsel Lily occurs in white, grey or yellow sand, sandy clay, gravel, laterite and granite in swampy areas, rock outcrops, flats, slopes and ridges.	Highly Unlikely – not suitable habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Calymperastrum latifolium		Priority 2		*Calymperastrum latifolium* is recorded from a shaded *Macrozamia* stem on a large rocky outcrop (Western Australian Herbarium, 1994).	No – no host plants on the site
Commersonia sp. Lesmurdie (A.A. Mitchell 11429)		Priority 2		*Commersonia* sp. Lesmurdie is recorded from sloping seepage with brown cracking clay soil on basalt sill (Western Australian Herbarium, 2022).	Highly Unlikely – not suitable habitat
Johnsonia pubescens subsp. *cygnorum*		Priority 2		Johnsonia pubescens subsp. cygnorum occurs on grey-white-yellow sand often overlying clays in Jarrah/Banksia woodland (Keighery, 2001) on flats on seasonally-wet sites	Highly Unlikely – not suitable habitat
Lepyrodia curvescens		Priority 2		*Lepyrodia curvescens* occurs in sand, laterite in seasonally inundated swampland.	Highly Unlikely – not suitable habitat
Leucopogon sp. Busselton (D. Cooper 243)		Priority 2		*Leucopogon* sp. Busselton is recorded from a seasonal dampland in seasonally wet, white sand (Western Australian Herbarium, 2011).	Highly Unlikely – not suitable habitat
Petrophile carduacea		Priority 2		Petrophile carduacea occurs in gravelly soils.	No – record in error – occurs in the Stirling Range
Poranthera moorokatta		Priority 2		*Poranthera moorokatta* grows in white silica sand and has been recorded in Banksia woodland and in a shallow dampland (Barrett, 2012).	Highly Unlikely – not suitable habitat
Scaevola paludosa		Priority 2		Scaevola paludosa prefers sandy soils.	No – record in error – occurs near Esperance
Stylidium falcatum	Slender Beaked Triggerplant	Priority 2		Slender Beaked Triggerplant occurs in sand, gravelly clay loam on plains, lateritic ridges.	No – record in error – occurs near Albany

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Thomasia brachystachys		Priority 2		*Thomasia brachystachys* occurs in littered, organic brown soil in high, open or dense forests.	No – record in error – occurs in the Stirling Range
Acacia drummondii subsp. *affinis*		Priority 3		*Acacia drummondii* subsp. *affinis* grows in lateritic gravelly soils.	Highly Unlikely – not suitable habitat
Acacia horridula		Priority 3		*Acacia horridula* grows in gravelly soils over granite, sand on rocky hillsides.	Highly Unlikely – not suitable habitat
Acacia oncinophylla subsp. *oncinophylla*		Priority 3		*Acacia oncinophylla* subsp. *oncinophylla* occurs in granitic soils	Highly Unlikely – not suitable habitat
Allocasuarina grevilleoides		Priority 3		*Allocasuarina grevilleoides* grows in sand over laterite, gravel.	Highly Unlikely – not suitable habitat
Amanita carneiphylla	Miller's Pink-Gilled Lepidella	Priority 3		Miller's Pink-Gilled Lepidella is a deeply rooting species and grows in sandy soil with *Eucalyptus*, *Banksia*, and *Allocasuarina* and at one site, Mediterranean *pine* (Pinus) was also found (Tulloss, 2022).	Highly Unlikely – not suitable habitat
Amanita drummondii	Drummond's Grisette	Priority 3		Drummond's Grisette is solitary to gregarious in leaf litter in association with *Agonis flexuosa, A. theiformis, Allocasuarina fraseriana, Corymbia calophylla, Eucalyptus marginata, E. patens, E. staeri, Jacksonia furcellata, Kunzea glabrescens, Melaleuca sp., Podocarpus drouynianus, Taxandria parviceps*. (Davidson *et al*., 2015) growing in sandy soil (Amanitaceae Org, 2015).	Highly Unlikely – not suitable habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Amanita fibrillopes	Peach Amanita	Priority 3		Peach Amanita is recorded from sandy or gravelly soil in dry sclerophyll forest and Banksia woodland, or in humus rich soil in seasonally wet eucalypt and paperbark woodland, often associated with *Eucalyptus marginata, E. jacksonii, Allocasuarina fraseriana, Corymbia calophylla, Melaleuca preissiana* and *Agonis* sp. (Davison *et al*., 2013).	Highly Unlikely – not suitable habitat
Amanita kalamundae	Kalamunda Lepidella	Priority 3		Kalamunda Lepidella is found In deep litter under *Eucalyptus patens* and *Agonis eriofolia* (Amanitaceae Org, 2018).	Highly Unlikely – not suitable habitat
Amanita preissii	Cinnamon-ring Lepidella	Priority 3		Cinnamon-ring Lepidella is found under shrubs and Eucalyptus in West Australia (Amanitaceae Org, 2015) in sandy soil and lateritic gravel, associated with *Allocasuarina fraseriana, Acacia pulchella, Corymbia calophylla, Callitris sp., Eucalyptus gomphocephala, E. marginata, Macrozamia fraseri* and *Pinus pinaster* (Davidson *et al.,* 2017).	Highly Unlikely – not suitable habitat
Angianthus drummondii		Priority 3		*Angianthus drummondii* grows in grey or brown clay soils, ironstone on seasonally wet flats.	Highly Unlikely – not suitable habitat
Angianthus micropodioides		Priority 3		*Angianthus micropodioides* occurs in saline sandy soils on river edges, saline depressions, claypans.	Highly Unlikely – not suitable habitat
Asteridea gracilis		Priority 3		Asteridea gracilis prefers sand, clay, gravelly soils.	Highly Unlikely – not suitable habitat
Babingtonia urbana	Coastal Plain Babingtonia	Priority 3		Coastal Plain Babingtonia occurs in orange sand, brown loam, white sandy clay on low flats, winter-wet swamps.	Highly Unlikely – not suitable habitat
Banksia pteridifolia subsp. *vernalis*		Priority 3		*Banksia pteridifolia* subsp. *vernalis* occurs in white/grey sand over laterite.	Unlikely – not typical habitat
Beaufortia purpurea	Purple Beaufortia	Priority 3		Purple Beaufortia occurs in lateritic or granitic soils on rocky slopes.	Unlikely – not typical habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Carex tereticaulis		Priority 3		Carex tereticaulis prefers black peaty sand.	Highly Unlikely – not peaty habitat
Chamaescilla gibsonii		Priority 3		*Chamaescilla gibsonii* grows in clay to sandy clay on winter-wet flats, shallow water-filled claypans.	Highly Unlikely – not claypan habitat
Comesperma rhadinocarpum	Slender-fruited Comesperma	Priority 3		Slender-fruited Comesperma occurs in sandy soils	Unlikely – not typical habitat
Conostylis bracteata		Priority 3		Conostylis bracteata occurs in sand, limestone on consolidated sand dunes.	Highly Unlikely – not dune habitat
Cupaniopsis anacardioides	Tuckeroo	Priority 3		Tuckeroo occurs in vine thickets.	No – record in error – occurs in the Kimberley
Cyathochaeta teretifolia		Priority 3		*Cyathochaeta teretifolia* occurs in grey sand, sandy clay on swamps, creek edges.	Unlikely – not typical habitat
Dampiera sericantha		Priority 3		*Dampiera sericantha* occurs in sand, sometimes with gravel on plains.	No – record in error – occurs in on the south coast
Dampiera triloba		Priority 3		*Dampiera triloba* grows in loamy sand (Australian National Herbarium, 2009) in lower lying areas.	Unlikely – not typical habitat
Dillwynia dillwynioides		Priority 3		*Dillwynia dillwynioides* occurs in sandy soils in winter-wet depressions.	Highly Unlikely – not suitable habitat
Eryngium subdecumbens		Priority 3		*Eryngium subdecumbens* grows in clay, grey sand on seasonally wet flats, claypans, swamps.	Highly Unlikely – not claypan habitat
Grevillea dissectifolia		Priority 3		*Grevillea dissectifolia* occurs in gravelly loam in moist areas and on roadsides.	Highly Unlikely – not suitable habitat
Haemodorum loratum		Priority 3		*Haemodorum loratum* prefers grey or yellow sand, gravel.	Highly Unlikely – not suitable habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Halgania corymbosa		Priority 3		*Halgania corymbosa* prefers gravelly soils, soils over granite.	Highly Unlikely – not suitable habitat
Isopogon autumnalis	Autumn Isopogon	Priority 3		Autumn Isopogon occurs in white, grey or yellow sand, often over laterite.	Unlikely – not typical habitat
Jacksonia gracillima		Priority 3		*Jacksonia gracillima* occurs in grey and brown well-drained sand.	Highly Unlikely – not suitable habitat
Lasiopetalum glutinosum subsp. *glutinosum*		Priority 3		*Lasiopetalum glutinosum* subsp. *glutinosum* occurs in lateritic and granitic soils.	Highly Unlikely – not suitable habitat
Lasiopetalum membranaceum		Priority 3		*Lasiopetalum membranaceum* grows in sand over limestone.	Highly Unlikely – not limestone habitat
Meionectes tenuifolia		Priority 3		*Meionectes tenuifolia* occurs on swamp margins on seasonally wet poorly drained flats or granite flats in shallow soils.	Highly Unlikely – not suitable habitat
Myriophyllum echinatum		Priority 3		*Myriophyllum echinatum* grows in clay on winter-wet flats.	Highly Unlikely – not clay habitat
Pimelea calcicola		Priority 3		Pimelea calcicola occurs in sand on coastal limestone ridges.	Highly Unlikely – not limestone habitat
Pithocarpa corymbulosa	Corymbose Pithocarpa	Priority 3		Corymbose Pithocarpa occurs in gravelly or sandy loam amongst granite outcrops.	Highly Unlikely – not clay habitat
Platysace ramosissima		Priority 3		*Platysace ramosissima* prefers sandy soils over limestone.	Highly Unlikely – not limestone habitat
Schoenus benthamii		Priority 3		*Schoenus benthamii* prefers white, grey sand, sandy clay in winter-wet flats, swamps.	Unlikely – not typical habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Schoenus capillifolius		Priority 3		*Schoenus capillifolius* grows in brown mud on claypans.	Highly Unlikely – not claypan habitat
Sporobolus blakei		Priority 3		*Sporobolus blakei* grows in red sandy clay, loam associated with creeks.	Unlikely – not typical habitat
Stackhousia sp. Red-blotched corolla (A. Markey 911)		Priority 3		*Stackhousia* sp. Red-blotched corolla is recorded from light brown yellow silty-gravel, with surface granite and lateritic gravel and cobbels, on a very steep slope (Western Australian Herbarium, 1996)	Highly Unlikely – not suitable habitat
Stylidium aceratum		Priority 3		*Stylidium aceratum* occurs in sandy soils in swamp heathland.	Highly Unlikely – not suitable habitat
Stylidium paludicola		Priority 3		*Stylidium paludicola* prefers peaty sand over clay in winter wet habitats in Marri and Melaleuca woodland, Melaleuca shrubland.	Highly Unlikely – not peaty habitat
Styphelia filifolia		Priority 3		*Styphelia filifolia* occurs in sandy soils of the coastal plain (with one known occurrence from the northern Darling Scarp), usually in Banksia or Jarrah woodland and in low-lying situations (Hislop and Lelièvre, 2017).	Unlikely – not typical habitat
Thysanotus anceps		Priority 3		*Thysanotus anceps* grows on white or grey sand, lateritic gravel, laterite.	Highly Unlikely – not lateritic habitat
Tricostularia drummondii	Drummond's Tricostularia	Priority 3		Drummond's Tricostularia grows in low woodland or mallee over sand or laterite, on flats, rises or sometimes in swampy areas (Barrett *et al*., 2021).	Unlikely – not typical habitat
Acacia oncinophylla subsp. *patulifolia*		Priority 4		*Acacia oncinophylla* subsp. *patulifolia* occurs on granitic soils, occasionally on laterite.	Highly Unlikely – not suitable habitat
Aponogeton hexatepalus	Stalked Water Ribbons	Priority 4		Stalked Water Ribbons grow in freshwater: ponds, rivers, claypans	Highly Unlikely – not suitable habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Calothamnus accedens		Priority 4		*Calothamnus accedens* occurs in sandy soils over laterite on road verges.	Highly Unlikely – not suitable habitat
Cyanothamnus tenuis	Blue Boronia	Priority 4		Blue Boronia prefers laterite, stony soils, granite.	Highly Unlikely – not suitable habitat
Darwinia pimelioides		Priority 4		*Darwinia pimelioides* prefers loam, sandy loam on granite outcrops.	Highly Unlikely – not suitable habitat
Dodonaea hackettiana	Hackett's Hopbush	Priority 4		Hackett's Hopbush occurs in sand with outcropping limestone.	Highly Unlikely – not limestone habitat
Drosera occidentalis	Western Sundew	Priority 4		The Western Sundew occurs in sandy and clayey soils in swamps and wet depressions.	Highly Unlikely – not suitable habitat
Grevillea pimeleoides		Priority 4		*Grevillea pimeleoides* grows in gravelly soils over granite on rocky hillsides.	Highly Unlikely – not suitable habitat
Hydrocotyle lemnoides	Aquatic Pennywort	Priority 4		Aquatic Pennywort occurs in swamps	Highly Unlikely – not suitable habitat
Jacksonia sericea	Waldjumi	Priority 4		Waldjumi grows in calcareous and sandy soils.	Highly Unlikely – not calcareous habitat
Lasiopetalum bracteatum	Helena Velvet Bush	Priority 4		Helena Velvet Bush occurs in sandy clay, clay, lateritic gravel along drainage lines, creeks, gullies, granite outcrops.	Highly Unlikely – not suitable habitat
Microtis quadrata	South Coast Mignonette Orchid	Priority 4		South Coast Mignonette Orchid occurs on clay based coastal flats (Brown *et al*., 2013).	Highly Unlikely – not suitable habitat
Ornduffia submersa		Priority 4		Ornduffia submersa grows in freshwater 0.05-0.6 m deep in pools, lakes, swamps, winter-wet depressions, claypans.	Highly Unlikely – not suitable habitat
Pimelea rara	Summer Pimelea	Priority 4		Summer Pimelea occurs in lateritic soils.	Highly Unlikely – not suitable habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Schoenus griffinianus		Priority 4		*Schoenus griffinianus* grows in white sand in low heath (Wilson, 1997).	Highly Unlikely – not suitable habitat
Senecio leucoglossus		Priority 4		*Senecio leucoglossus* prefers gravelly lateritic or granitic soils with granite outcrops on slopes.	Highly Unlikely – not suitable habitat
Stylidium longitubum	Jumping Jacks	Priority 4		Jumping Jacks prefer sandy clay, clay in seasonal wetlands.	Highly Unlikely – not clay habitat
Thysanotus glaucus		Priority 4		*Thysanotus glaucus* occurs in white, grey or yellow sand, sandy gravel.	Unlikely – not typical habitat
Verticordia lindleyi subsp. *lindleyi*		Priority 4		*Verticordia lindleyi* subsp. *lindleyi* prefers sand, sandy clay in winter-wet depressions.	Highly Unlikely – not suitable habitat

* sourced from Florabase as well as the DBCA database searches unless otherwise denoted

3.5.5 TEC/PEC Database Search

A search of DBCA's Threatened (TEC) and Priority Ecological Communities (PEC) database identified six TECs and seven PECs (Appendix 5) as having been recorded within 10km of the site. Two of the PECs are part of a Federally listed TEC. The communities identified in the database searches are outlined in Table 4.

Table 4: TEC and PECs Identified in Database Search

Number	Description	Conservation Status in Western Australia	Status under the EPBC Act
SCP02	Southern wet shrublands, Swan Coastal Plain (floristic community type 2 as originally described in Gibson et al. 1994)	Critically Endangered	
SCP3a	*Corymbia calophylla - Kingia australis* woodlands on heavy soils (floristic community type 3a as originally described in Gibson et al. 1994)	Critically Endangered	Endangered
SCP3b	*Corymbia calophylla - Eucalyptus marginata* woodlands on sandy clay soils of the southern Swan Coastal Plain (floristic community type 3b as originally described in Gibson et al. 1994)	Endangered	
SCP3c	*Corymbia calophylla - Xanthorrhoea preissii* woodlands and shrublands, Swan Coastal Plain (floristic community type 3c as originally described in Gibson et al. 1994)	Endangered	Endangered
SCP20a	*Banksia attenuata* woodlands over species rich dense shrublands (floristic community type 20a as originally described in Gibson et al. 1994)	Critically Endangered	Endangered as part of the Banksia WL SCP
SCP20c	Shrublands and woodlands of the eastern side of the Swan Coastal Plain (floristic community type 20c as originally described in in Gibson et al. 1994)	Critically Endangered	Endangered
SCP07	Herb rich saline shrublands in clay pans (floristic community type 7 as originally described in Gibson et al. 1994)	Endangered	Critically Endangered as part of the Herb Rich Saline Shrublands in Clay Pans
SCP08	Herb rich shrublands in clay pans (floristic community type 8 as originally described in Gibson et al. 1994)	Endangered	Critically Endangered as part of the Herb Rich Saline Shrublands in Clay Pans
SCP10a	Shrublands on dry clay flats (floristic community type 10a as originally described in Gibson et al. 1994)	Endangered	Critically Endangered

Number	Description	Conservation Status in Western Australia	Status under the EPBC Act
Muchea Limestone	Shrublands and woodlands on Muchea Limestone of the Swan Coastal Plain	Endangered	Endangered
SCP21c	Low lying *Banksia attenuata* woodlands or shrublands	Priority 3	Endangered as part of the Banksia WL SCP
Banksia WL SCP	Banksia Woodlands of the Swan Coastal Plain ecological community	Priority 3	Endangered
Coastal Saltmarsh	Subtropical and Temperate Coastal Saltmarsh	Priority 3	Vulnerable
Central Granite Shrublands (Com 5, Markey)	Central Northern Darling Scarp Granite Shrubland Community	Priority 4	

The Banksia Woodland TEC is mapped on the site over an area that is mapped as *Eucalyptus rudis* Woodland to Low Forest over *Melaleuca rhaphiophylla* Low Forest over Arum Lily which is not representative of the TEC and therefore the mapping was not considered to be accurate.

3.5.6 Flora

No Threatened or Priority flora species have been recorded on the site and none were recorded during the Reconnaissance survey. A low number of native species were recorded on the site including:

- *Eucalyptus rudis* (Flooded Gum);
- *Melaleuca rhaphiophylla* (Paperbark);
- *Astartea fascicularis*;
- *Typha orientalis* (Bulrush);
- *Juncus pallidus* (Pale Rush);
- *Hypocalymma angustifolium* (Pink-flowered Myrtle);
- *Lepidosperma longitudinale* and
- *Dielsia stenostachya.*

Most of the trees on the site are planted exotic species.

Weed species recorded on the site included:

- *Arctotheca calendula* (Cape Weed);
- *Cenchrus clandestinus* (Kikuyu);
- *Conyza bonariensis* (Fleabane);
- *Cynodon dactylon* (Couch);
- *Eragrostis curvula* (African Lovegrass);
- *Holcus lanatus* (Yorkshire Fog grass);
- *Leptospermum laevigatum* (Victorian Teatree);

- *Moraea flaccida* (Cape Tulip);
- *Oxalis pes-caprae* (Soursob);
- *Paspalum dilatatum* (Paspalum);
- *Pelargonium capitatum* (Rose Pelargonium);
- *Rumex acetosella* (Sorrel);
- *Schinus terebinthifolia* (Brazilian Pepper trees);
- *Taraxacum officinale* (Dandelion);
- *Taraxacum officinale* (Dandelion);
- *Trifolium* sp. (Clover); and
- *Vicia sativa* (Common Vetch).

The creekline has a weedy understorey of:

- *Cenchrus clandestinus* (Kikuyu);
- *Zantedeschia aethiopica* (Arum Lily) – a Declared Pest and Weed of National Significance (WoNS);
- *Washingtonia filifera* (Cotton Palm);
- *Gomphocarpus fruticosus* (Cotton Bush), a Declared Pest; and
- *Arundo donax* (False Bamboo).

3.5.7 Vegetation Complex

Vegetation Complexes are a broad level of vegetation description which is based on the underlying geomorphology and rainfall (Heddle *et al*., 1980). The vegetation on the site is part of the Southern River Vegetation Complex (Heddle *et al.,* 1980). The Southern River Vegetation Complex is described as "open woodland of *Corymbia calophylla-Eucalyptus marginata-Banksia* species with fringing woodland of *Eucalyptus rudis-Melaleuca rhaphiophylla* along creek beds". This vegetation is too degraded to be a good example of this vegetation complex.

3.5.8 Vegetation Types

Five vegetation types have been described on the site in 2014 and the 2025. The vegetation previously recorded on Lot 200 Kalamunda Road, Lot 100 and Lot 9000 Adelaide Street has since been cleared from earlier observations. The remaining vegetation types are:

Cleared Areas that contain no, or very few, native plants and are vegetated by exotic species.

ErMr *Eucalyptus rudis* Woodland to Low Forest over *Melaleuca rhaphiophylla* Low Forest over Arum Lily.

Er *Eucalyptus rudis* Woodland to Low Forest over Pasture.

Mr *Melaleuca rhaphiophylla* Low Woodland over Typha and Arum Lily.

MrAf *Melaleuca rhaphiophylla/Astartea fascicularis* Thicket to Low Woodland (Figure 3).

3.5.9 Vegetation Condition

The condition of the vegetation was assessed according to the system devised by Keighery and described in Bush Forever (Government of Western Australia, 2000) (Table 5).

Table 5: Vegetation Condition Rating Scale

Condition	Description
Pristine	Pristine or nearly so, no obvious signs of disturbance.
Excellent	Vegetation structure intact, disturbance affecting individual species and weeds are non-aggressive species.
Very Good	Vegetation structure altered, obvious signs of disturbance. For example, disturbance to vegetation structure caused by repeated fires, the presence of some more aggressive weeds, dieback, logging and grazing.
Good	Vegetation structure significantly altered by very obvious signs of multiple disturbance. Retains basic vegetation structure or ability to regenerate it. For example, disturbance to vegetation structure caused by very frequent fires, the presence of some very aggressive weeds at high density, partial clearing, dieback and grazing.
Degraded	Basic vegetation structure severely impacted by disturbance. Scope for regeneration but not to a state approaching good condition without intensive management. For example, disturbance to vegetation structure caused by very frequent fires, the presence of very aggressive weeds, partial clearing, dieback and grazing.
Completely Degraded	The structure of the vegetation is no longer intact and the area is completely or almost completely without native species. These are often described as 'parkland cleared' with the flora comprising weed or crop species with isolated native trees or shrubs.

Source: Government of Western Australia, 2000.

A large area of the site has been cleared for rural purposes or contains only introduced species and is Completely Degraded. The northern area is considered to be Degraded to Completely Degraded and consists of native trees over bare sand and weeds. The small eastern area of remnant vegetation associated with the RE wetland is considered to be in Degraded to Good Condition and consists of a native tree and sedge species with a number of weed species present. The western area of wetland vegetation is considered to be in Degraded Condition with native trees over weeds.

There is an abundance of the Declared Weed *Zantedeschia aethiopica* (Arum Lily) in the western area. In addition, the aggressive wetland species *Typha orientalis* (Bulrush) is abundant in the drainage line.

Vegetation condition is shown in Figure 4.

3.5.10 Conservation Significance of Flora and Vegetation

3.5.10.1 Flora

The were no conservation significant species that were deemed likely to be on the site. The overall poor condition of the vegetation suggests the potential for any of these species to occur is extremely low. All species identified are perennial species so would have been present during the reconnaissance survey.

3.5.10.2 Vegetation Association

The Southern River complex has 18.43% of its pre-European extent remaining, of which 1.37% is protected for conservation purposes (DBCA, 2018). The EPA considers that vegetation complexes with less than 10% remaining in constrained areas such as the Perth Metropolitan Region are regionally significant and that for these complexes there is a presumption that all areas of remnant native

vegetation where less than 10% remains will be retained and conserved. The 18.43% retention amount for the Southern River Complex is above the 10% target.

The vegetation on the site is too degraded to be a good representation of this vegetation complex.

3.5.10.3 Threatened and Priority Ecological Communities

There is no intact vegetation on the site and therefore no vegetation that is representative of a Threatened or Priority Ecological Community.

3.6 Fauna

3.6.1 Methodology

A Basic Fauna Survey was undertaken in accordance with EPA Technical Guidance *Fauna Surveys for Environmental Impact Assessment* (EPA, 2020). Desktop studies were undertaken to identify habitats and potential threatened species that may occur on the site.

Searches of the following databases were undertaken prior to the site survey:

- Atlas of Living Australia (ALA, 2025) which shows all species that have been recorded within a 10km radius of the site (Appendix 2).
- The EPBC Act Protected Matters Search Tool (DCCEEW, 2025) (Appendix 3) which identifies species that are listed under the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) that could potentially have habitat within a 5km radius of the site.

A site reconnaissance was conducted by PGV Environmental on 7 July 2025 to describe the fauna habitats on the site. Desktop studies were undertaken to identify habitats and potential threatened species that may occur on the site. The likelihood of the site providing habitat to identified conservation significant fauna species was determined.

3.6.2 Fauna Habitats

There are four fauna habitats on the site as follows:

- Upland Banksia sp. and Eucalyptus todtiana scattered over cleared understorey;
- Wetland with Melaleuca rhaphiophylla and Eucalyptus rudis over weedy understorey;
- Wetland with weeds; and
- Cleared paddocks with scattered exotic trees.

The cleared hardstand area is not considered to have any fauna habitat value.

Fauna habitat can be assessed using a number of factors including, the size of the habitat, the level of habitat connectivity, availability of specific resources (e.g., tree hollows) and overall vegetation quality. The habitat was assessed according to the categories in Table 6.

Table 6: Fauna Habitat Value

Habitat Value	Description
High Quality Fauna Habitat	These areas closely approximate the vegetation mix and quality that would have been in the area prior to any disturbance. The habitat has connectivity with other habitats and is likely to contain the most natural vertebrate fauna assemblage.

Habitat Value	Description
Very Good Fauna Habitat	These areas show minimal signs of disturbance (e.g., grazing, clearing, fragmentation, weeds) and generally retain many of the characteristics of the habitat if it had not been disturbed. The habitat has connectivity with other habitats and fauna assemblages in these areas are likely to be minimally affected by disturbance.
Good Fauna Habitat	These areas showed signs of disturbance (e.g., grazing, clearing, fragmentation, weeds) but generally retain many of the characteristics of the habitat if it had not been disturbed. The habitat has connectivity with other habitats and fauna assemblages in these areas are likely to be affected by disturbance.
Disturbed Fauna Habitat	These areas showed signs of significant disturbance. Many of the trees, shrubs and undergrowth are cleared. These areas may be in the early succession and regeneration stages. Areas may show signs of significant grazing, contain weeds or have been damaged by vehicle or machinery. Habitats are fragmented or have limited connectivity with other fauna habitats. Fauna assemblages in these areas are likely to differ significantly from what might be expected in the area had the disturbance not occurred.
Highly Degraded Fauna Habitat	These areas often have a significant loss of vegetation, an abundance of weeds, and a large number of vehicle tracks or are completely cleared. Limited or no fauna habitat connectivity. Faunal assemblages in these areas are likely to be significantly different to what might have been in the area pre-disturbance.

From: Coffey Environments, 2009

The quality of the fauna habitat on the site is also limited due to it being fragmented from other areas of native vegetation, the closest being Munday Swamp approximately 1km to the south-west. The scattered parkland trees are considered to be Highly Degraded Fauna Habitat due to the cleared understorey.

The wetland areas on the site containing native trees are considered to be Disturbed Fauna Habitat. The understorey consists completely of weeds apart from a small section in the eastern area containing *Lepidosperma longitudinale*. The eastern section has been invaded by Brazilian Pepper trees and the western section contains an abundance of Arum Lily. The drainage line with weeds such as False Bamboo and Bulrushes is considered to be Highly Degraded Fauna Habitat due to the absence of any native flora species.

The cleared paddocks with scattered exotic trees on the site consist of Highly Degraded Fauna Habitat due to the significant loss of vegetation. The increased amounts of grass and weed species are likely to result in a high abundance of introduced fauna species such as House Mice and Black Rats. The drainage line is disturbed fauna habitat but provides habitat for some frog and waterbird species and there is anecdotal evidence that it supports a population of Oblong Turtles (*Chelodina oblonga*).

3.6.3 Conservation Significant Species

Outlined in Table 7 is a short description of the preferred habitat for each of the species that were identified in the database searches and their preferred habitats. The preferred habitat has been compared to the habitats on the site described above and the likelihood of each species to be present was determined. Species recorded in the database search results that live in the ocean or birds that are marine and pelagic have not been included in the assessment. No records are located on the site.

Table 7: Identified Significant Fauna Species and Likelihood of Occurring on the Site

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Bettongia penicillata ogilbyi	Woylie, Brush-tailed Bettong	Critically Endangered	Endangered	The Woylie habitat types ranged from forest to grassland, coastal and inland. During the day the Woylie shelters under patches of dense undergrowth, logs and rock-cavities and occasionally in burrows.	Highly Unlikely – not suitable habitat and the site is too disturbed
Calidris ferruginea	Curlew Sandpiper	Critically Endangered	Critically Endangered	Curlew Sandpipers mainly occur on intertidal mudflats in sheltered coastal areas, such as estuaries, bays, inlets and lagoons, and also around non-tidal swamps, lakes and lagoons near the coast, and ponds in saltworks and sewage farms.	Highly Unlikely – not suitable habitat and the site is too disturbed
Cherax tenuimanus	Margaret River Hairy Marron	Critically Endangered	Critically Endangered	The Margaret River Hairy Marron occurs in fresh water in the Margaret River Area.	No – no suitable habitat
Numenius madagascariensis	Eastern Curlew	Critically Endangered	Critically Endangered	The Eastern Curlew is most commonly associated with sheltered coasts, especially estuaries, bays, harbours, inlets and coastal lagoons, with large intertidal mudflats or sandflats, often with beds of seagrass. Occasionally, the species occurs on ocean beaches (often near estuaries), and coral reefs, rock platforms, or rocky islets.	Highly Unlikely – not suitable habitat and the site is too disturbed
Pseudemydura umbrina	Western Swamp Tortoise	Critically Endangered	Critically Endangered	The Western Swamp Tortoise is restricted to very few wild populations. During winter and spring, the tortoises live in the water. This species is carnivorous feeding on insects, larvae and tadpoles (Burbidge and Kuchling, 1994). In the drier, hotter months they shelter under leaf litter and in holes and aestivate (sleep).	No – not suitable habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Pseudocheirus occidentalis	Western Ringtail Possum, Ngwayir	Critically Endangered	Critically Endangered	The Western Ringtail Possum is a medium sized nocturnal marsupial. This species occurs in and near coastal Peppermint Tree (*Agonis flexuosa*) forest and Tuart (*Eucalyptus gomphocephala*) dominated forest with a Peppermint Tree understorey.	No – not suitable habitat
Botaurus poiciloptilus	Australasian bittern	Endangered	Endangered	The Australasian Bittern occurs mainly in densely vegetated freshwater wetlands and, rarely, in estuaries or tidal wetlands.	Highly Unlikely – not suitable habitat and the site is too disturbed
Leioproctus douglasiellus	A Short-tongued Bee	Endangered	Critically Endangered	The short-tongued bee species is only known from three locations within the Perth metropolitan area ranging from Cannington to Forrestdale. Specimens have been collected on two plant species, Goodenia filiformis and Anthotium junciforme (TSSC, 2013).	Highly Unlikely – no suitable host plants
Myrmecobius fasciatus	Numbat, Walpurti	Endangered	Endangered	Numbats occur in eucalypt forests and woodlands dominated by *Eucalyptus marginata*, *Corymbia calophylla* and *Eucalyptus wandoo*.	Highly Unlikely – not suitable habitat and the site is too disturbed
Rostratula australis	Australian Painted Snipe	Endangered	Endangered Marine/ Migratory	The Australian Painted Snipe has been recorded at wetlands in all states of Australia but is most common in eastern Australia. It generally inhabits shallow terrestrial freshwater (occasionally brackish) wetlands, including temporary and permanent lakes, swamps and claypans. It also uses inundated or waterlogged grassland or saltmarsh, dams, rice crops, sewage farms and bore drains. Typical sites include a cover of vegetation, including grasses.	Highly Unlikely – not suitable habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Zanda baudinii	Baudin's Black Cockatoo	Endangered	Endangered	Baudin's Black-Cockatoo mainly occurs in eucalypt forests, especially Jarrah (Eucalyptus marginata), Marri (Corymbia calophylla), also Karri (Eucalyptus diversicolor) forest, often feeding in the understorey on proteaceous trees and shrubs, especially banksias (DAWE, 2022).	Possible intermittent visitor– limited habitat occurs on the site
Zanda latirostris	Carnaby's Black Cockatoo	Endangered	Endangered	Carnaby's Cockatoo is found in the south-west of Australia from Kalbarri through to Ravensthorpe. It has a preference for feeding on the seeds of Banksia, Hakea, Eucalyptus, Grevillea, Pinus and Allocasuarina spp. It is nomadic often moving toward the coast after breeding. It breeds in tree hollows that are 2.5 - 12m above the ground and have an entrance 23-30cm with a depth of 1-2.5m. Nesting mostly occurs in smooth-barked trees (e.g. Salmon Gum, Wandoo, Red Morrell) (DAWE, 2022).	Possible intermittent visitor– limited habitat occurs on the site
Calyptorhynchus banksii naso	Forest Red-tailed Black-Cockatoo	Vulnerable	Vulnerable	Forest Red-tailed Black Cockatoos frequent the humid to sub-humid south-west of Western Australia from Gingin in the north, to Albany in the south and west to Cape Leeuwin and Bunbury (DAWE, 2022). It nests in tree hollows with a depth of 1-5m, that are predominately Marri (Corymbia calophylla), Jarrah (Eucalyptus marginata) and Karri (Eucalyptus diversicolor) and it feeds primarily on the seeds of Marri (DAWE, 2022).	Possible intermittent visitor– limited habitat occurs on the site
Charadrius leschenaultii	Greater Sand Plover	Vulnerable	Vulnerable/ Marine/ Migratory	In Australasia, the Greater Sand Plover is almost entirely coastal, inhabiting littoral and estuarine habitats. They mainly occur on sheltered sandy, shelly or muddy beaches with large intertidal mudflats or sandbanks, as well as sandy estuarine lagoons.	Highly Unlikely – not suitable habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Dasyurus geoffroii	Chuditch, Western Quoll	Vulnerable	Vulnerable	The Chuditch have been known to occupy a wide range of habitats including woodlands, dry sclerophyll forests, riparian vegetation, beaches and deserts. They are opportunistic feeders, and forage on the ground at night, feeding on invertebrates, small mammals, birds and reptiles.	Highly Unlikely –the site is too disturbed and surrounded by development
Leipoa ocellata	Mallee Fowl	Vulnerable	Vulnerable	Mallee fowl have been found in mallee regions of southern Australia from approximately the 26th parallel of latitude southwards in mallee bushland.	No – not mallee habitat
Macrotis lagotis	Bilby, Dalgyte, Ninu	Vulnerable	Vulnerable	The greater Bilby is a nocturnal omnivorous marsupial that shrub species, such as *Acacia kempeana* and *A. hilliana*, which have root-dwelling larvae that provide a constant food source for the Greater Bilby. They also utilise Spinifex hummocks which are quite uniform and discrete, providing runways between hummocks, enabling easier movement and foraging.	Highly Unlikely – species occurs in northern Australia
Setonix brachyurus	Quokka	Vulnerable	Vulnerable	Quokkas were originally very common on the Swan Coastal Plain, however, their distribution is now limited to Rottnest Island and a few isolated areas in the south-west of WA. On the mainland, they prefer densely vegetated areas around wetlands and streams, whereas on Rottnest Island they inhabit low scrubby coastal vegetation where water is not readily available year-round.	Highly Unlikely – not suitable habitat and the species is thought to be locally extinct
Sternula nereis nereis	Australian Fairy Tern	Vulnerable	Vulnerable	The Fairy Tern (Australian) nests on sheltered sandy beaches, spits and banks above the high tide line and below vegetation.	Highly Unlikely – not suitable
Westralunio carteri	Carter's Freshwater Mussel	Vulnerable	Vulnerable	Carter's Feshwater Mussel is South-West Western Australia's only freshwater mussel (Murdoch University & SERCUL, 2012). Carter's Freshwater Mussel occurs in freshwater streams, rivers, reservoirs and lakes (ICUN, 2015b) and is intolerant to dehydration for more than three days and salinity (Murdoch University & SERCUL, 2012).	No - not suitable habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Actitis hypoleucos	Common Sandpiper	Migratory	Marine/ Migratory	The Common Sandpiper is mostly found around muddy margins or rocky shores. Generally the species forages in shallow water and on bare soft mud at the edges of wetlands.	Highly Unlikely – not suitable habitat and the site is too disturbed
Apus pacificus	Fork-tailed Swift	Migratory	Marine/Migratory	The Fork-tailed Swift is almost exclusively aerial and is not known to breed in Australia. They are seen in inland plains but sometimes above foothills or in coastal areas. They often occur over cliffs and beaches and also over islands and sometimes well out to sea. They also occur over settled areas, including towns, urban areas and cities. Apus pacificus subsp. pacificus is the only subspecies to migrate to Australia.	Highly Unlikely – may fly overhead but unlikely to land
Arenaria interpres	Ruddy Turnstone	Migratory	Vulnerable/ Marine/ Migratory	The Ruddy Turnstone is mainly found on coastal regions with exposed rock coast lines or coral reefs. It also lives near platforms and shelves, often with shallow tidal pools and rocky, shingle or gravel beaches.	Highly Unlikely – not suitable habitat
Calidris acuminata	Sharp-tailed Sandpiper	Migratory	Vulnerable/ Marine/ Migratory	The Sharp-tailed Sandpiper prefers muddy edges of shallow fresh or brackish wetlands, with inundated or emergent sedges, grass, saltmarsh or other low vegetation.	Highly Unlikely – not suitable habitat and the site is too disturbed
Calidris melanotos	Pectoral Sandpiper	Migratory	Marine/ Migratory	The Pectoral Sandpiper prefers shallow fresh to saline wetlands and is found at coastal lagoons, estuaries, bays, swamps, lakes, inundated grasslands, saltmarshes, river pools, creeks, floodplains and artificial wetlands.	Highly Unlikely – not suitable habitat and the site is too disturbed

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Limosa lapponica	Bar-tailed Godwit	Migratory	Marine/ Migratory	The Bar-tailed Godwit is found mainly in coastal habitats such as large intertidal sandflats, banks, mudflats, estuaries, inlets, harbours, coastal lagoons and bays.	Highly Unlikely – not suitable habitat and the site is too disturbed
Limosa limosa	Black-tailed Godwit	Migratory	Endangered /Migratory/ Marine	The Black-tailed Godwit is found mainly in coastal habitats such as large intertidal sandflats, banks, mudflats, estuaries, inlets, harbours, coastal lagoons and bays. It is found often around beds of seagrass and, sometimes, in nearby saltmarsh.	Highly Unlikely – not suitable habitat and the site is too disturbed
Motacilla cinerea	Grey Wagtail	Migratory	Migratory/ Marine	The Grey Wagtail is mostly recorded in coastal areas in Western Australia (ALA, 2015) however is widespread. There is non-breeding habitat only in Australia and the species has a strong association with water, particularly rocky substrates along water courses but also lakes and marshes.	Highly Unlikely – the site is too disturbed
Pandion haliaetus	Osprey	Migratory	Marine/ Migratory	Ospreys occur in littoral and coastal habitats and terrestrial wetlands of tropical and temperate Australia and offshore islands. They feed on fish, especially mullet where available, and rarely take molluscs, crustaceans, insects, reptiles, birds and mammals.	Highly Unlikely – not suitable habitat
Plegadis falcinellus	Glossy Ibis	Migratory	Marine/Mig ratory	The Glossy Ibis is the smallest ibis known in Australia. This species preferred habitat for foraging and breeding are fresh water marshes at the edges of lakes and rivers, lagoons, flood-plains, wet meadows, swamps, reservoirs, sewage ponds, rice-fields and cultivated areas under irrigation but do not breed in South-west Western Australia.	Highly Unlikely – not suitable habitat and the site is too disturbed

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Pluvialis fulva	Pacific Golden Plover	Migratory	Marine/ Migratory	Pacific Golden Plovers usually occur on beaches, mudflats and sandflats (sometimes in vegetation such as mangroves, low saltmarsh such as *Sarcocornia*, or beds of seagrass) in sheltered areas including harbours, estuaries and lagoons, and also in evaporation ponds in salt works.	Highly Unlikely – not suitable habitat and the site is too disturbed
Pluvialis squatarola	Grey Plover	Migratory	Vulnerable/ Marine/ Migratory	Grey Plovers occur almost entirely in coastal areas, where they usually inhabit sheltered embayments, estuaries and lagoons with mudflats and sandflats, and occasionally on rocky coasts with wave-cut platforms or reef-flats, or on reefs within muddy lagoons.	Highly Unlikely – not suitable habitat
Tringa nebularia	Common Greenshank	Migratory	Endangered /Marine/ Migratory	The Common Greenshank is a wader and does not breed in Australia. This species can be found in many types of wetlands and has the widest distribution of any shorebird in Australia. This species typically feeds on molluscs, crustaceans, insects, and occasionally fish and frogs.	Highly Unlikely –the site is too disturbed
Xenus cinereus	Terek Sandpiper	Migratory	Vulnerable/ Marine/ Migratory	The Terek Sandpiper mostly forages in the open, on soft wet intertidal mudflats or in sheltered estuaries, embayments, harbours or lagoons. The species has also been recorded on islets, mudbanks, sandbanks and spits, and near mangroves and occasionally in samphire (Halosarcia spp.).	Highly Unlikely – not suitable habitat and the site is too disturbed
Ardea alba	Great Egret, White Egret		Marine	The Eastern Great Egret has been reported in a wide range of wetland habitats and usually frequents shallow waters. This species feeds on fish, insects, crustaceans, molluscs, frogs, lizards, snakes and small birds and mammals.	Highly Unlikely –the site is too disturbed

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Bubulcus ibis	Cattle Egret		Marine	The Cattle Egret occurs in tropical and temperate grasslands, wooded lands and terrestrial wetlands with breeding in Western Australia recorded in the far north in Wyndham in colonies in wooded swamps such as mangrove forest. This species forages away from water on low lying grasslands, improved pastures and croplands generally in areas that have livestock eating insects, frog, lizards and small mammals.	Highly Unlikely – the site is too disturbed
Egretta sacra	Eastern Reef Egret, Eastern Reef Heron		Marine	The Eastern Reef Egret nests in trees in island woodlands, or on the ground under shrubs or rock ledges and feeds on small fish, crustaceans and insects (Birdlife Australia, 2014).	Highly Unlikely – not suitable habitat and the site is too disturbed
Haliaeetus leucogaster	White-bellied Sea-eagle		Marine	The White-bellied Sea-Eagle is found in coastal habitats with large areas of open water, especially those close to the sea-shore. This species feeds opportunistically on a variety of fish, birds, reptiles, mammals and crustaceans, and on carrion and offal.	Highly Unlikely – not suitable habitat
Himantopus himantopus	Black-winged Stilt		Marine	The Black-winged Stilt is found near coastal lagoons and shallow freshwater or brackish pools with extensive areas of mudflats, salt meadows, saltpans, coastal marshes and swamps (Birdlife International, 2014a).	Highly Unlikely – not suitable habitat
Merops ornatus	Rainbow Bee-eater		Marine	Populations of the Rainbow Bee-eater that breed in northern Australia are considered to be resident, and in many northern localities the Rainbow Bee-eater is present throughout the year. The Rainbow Bee-eater nests in a burrow dug in the ground. It is found across the better-watered parts of WA including islands preferring lightly wooded, sandy country near water.	Possible intermittent visitor to the site but unlikely to rely on the site for survival

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Recurvirostra novaehollandiae	Red-necked Avocet		Marine/ Migratory	The Red-necked Avocet occurs in wetland areas including bogs, marshes, swamps and permanent saline, brackish or alkaline lakes generally preferring saline habitats (BirdsSA, 2025).	Highly Unlikely – not suitable habitat
Glossurocolletes bilobatus	A Short-tongued Bee (southwest)	Priority 2		The *Glossurocolletes bilobatus* bee species is known to utilise the yellow flowering pea, *Gompholobium aristatum* (Phoenix, 2010).	Highly Unlikely – no host plants occur on the site
Acanthophis antarcticus	Southern Death Adder	Priority 3		Southern Death Adders inhabit a range of habitats, including rainforest, scrubland, semi arid zones and rocky outcrops. Typically during the day they remain mostly buried beneath sand, soil or debris, with just the tail and top of the head exposed. They do not actively hunt their prey but are cryptic snakes which sit motionlessly, sometimes for months on end, constantly watching for any animal which unwittingly comes within striking distance (Pilbara Pythons, 2014).	Highly Unlikely – not suitable habitat and the site is too disturbed
Ctenotus ora	Coastal Plains Skink	Priority 3		The Coastal Plains Skink has been identified on coastal plains in dune habitats (AROD, 2012).	Possible – may occur in sandier areas of the site
Euoplos inornatus	Inornate Trapdoor Spider (northern Jarrah Forest)	Priority 3		The Inornate Trapdoor Spider is recorded from clay creek banks (ALA, 2019).	Highly Unlikely – not suitable habitat
Geotria australis	Pouched Lamprey	Priority 3		The Pouched Lamprey is spawned in freshwater systems and then migrate to sea before returning to freshwater to spawn and die (OzFishNet, 2014).	No – no suitable habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Idiosoma sigillatum	Swan Coastal Plain shield-backed trapdoor spider	Priority 3		The Swan Coastal Plain Shield-backed Trapdoor Spider arranges fallen twigs from the sheoak tree around the rim of its burrow entrance, enabling it to feel the vibrations of unsuspecting prey that wander by (Curtin, 2018).	Highly Unlikely – not suitable habitat
Lerista lineata	Perth Slider, Lined Skink	Priority 3		The Lined Skink is a burrowing species that occurs in pale sandy soils with coastal heath and shrubland areas in isolated populations in the south-west and mid-west coast of Western Australia. It feeds on termites and other small insects (AROD, 2014).	Unlikely – the site is too disturbed
Botaurus dubius	Australian Little Bittern	Priority 4		The Australian Little Bittern is mainly found in freshwater wetlands, where they inhabit dense emergent vegetation of reeds and sedges, and inundated shrub thickets. They are also occasionally found in brackish and saline wetlands such as mangrove swamps, Juncus-dominated salt marsh and the wooded margins of coastal lagoons (Naturewatch NZ, 2014).	Highly Unlikely – not suitable habitat and the site is too disturbed
Ctenotus delli	Dell's Ctenotus, Darling Range Heath Ctenotus	Priority 4		Dell's Ctenotus is found in the north Darling Range of south-western WA in dry sclerophyll forests on stony hills and ranges (Cogger, 2014).	Highly Unlikely – not suitable habitat
Elanus scriptus	Letter-winged Kite	Priority 4		The Letter-winged Kite is found in open or sparsely wooded country (Johnstone and Storr, 1998).	Highly Unlikely – not suitable habitat and the site is too disturbed
Falsistrellus mackenziei	Western False Pipistrelle	Priority 4		The Western False Pipistrelle occurs in high rainfall Jarrah, Karri and Tuart forests and coastal woodlands. They roost in hollows of trees, branches and stumps, and are insectivorous, feeding at night between the canopy and understorey of tall forest trees (Environment Australia, 1999).	Highly Unlikely – not suitable habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Hydromys chrysogaster	Water-rat, Rakali	Priority 4		The Water Rat generally prefers wetland habitats characterised by dense, low-lying vegetation (0–30 cm from ground), low-density canopy cover and shallow, narrow water bodies (Speldewinde *et al*., 2013).	Possible – habitat may occur on the site
Isoodon fusciventer	Southern Brown Bandicoot, Quenda	Priority 4		Southern Brown Bandicoots are small grey marsupials that prefer dense scrub (up to one metre high). Their diet includes invertebrates (including earthworms, adult beetles and their larvae), underground fungi, subterranean plant material, and very occasionally, small vertebrates (DEC, 2012).	Unlikely – not suitable habitat and the site is too disturbed
Notamacropus irma	Western Brush Wallaby	Priority 4		The Western Brush Wallaby is a medium sized marsupial and its optimum habitat is open forest or woodland, particularly favouring open, seasonally wet flats with low grasses and open scrubby thickets (DEC, 2012).	Highly Unlikely –the site is too disturbed
Oxyura australis	Blue-billed Duck	Priority 4		The Blue-billed Duck is found on terrestrial wetlands in temperate regions, that are freshwater to saline, and may be natural or artificial. It nests in rushes, sedges, Lignum Muehlenbeckia cunninghamii and paperbark Melaleuca (Birdlife International, 2015). The species is almost completely aquatic, and is seldom seen on land. Non-breeding flocks, often with several hundred individuals, congregate on large, deep open freshwater dams and lakes in autumn. The daylight hours are spent alone in small concealed bays within vegetation or communally in large exposed rafts far from the shore (Birds in Backyards, 2015).	Highly Unlikely – not suitable habitat

Scientific Name	Common Name	Conservation Status (WA)	Status under EPBC Act	Habitat*	Likelihood to occur on the site
Synemon gratiosa	Graceful Sun-moth	Priority 4		The Graceful Sun-moth is a diurnal moth with dull coloured brown to black forewings and brightly coloured orange hind wings. The larvae burrow into the rhizomes of Lomandra maritima and Lomandra hermaphrodita exclusively and therefore require the presence of one or both of these species to be present in an area (Bishop et al., 2011).	No - no host plant species occur on the site
Charadrius cucullatus (Listed under the EPBC Act as *Thinornis rubricollis*)	Hooded Plover	Priority 4	Marine	The Hooded Plover primarily inhabits sandy, ocean beaches, with the highest densities on beaches with large amounts of beach-washed seaweed that are backed by extensive open dunes. In Western Australia the species also inhabits inland and coastal salt lakes (Birdlife International, 2014b).	Highly Unlikely – not suitable habitat

* Sourced from the SPRAT Database (DoEE, 2018) unless otherwise indicated

In summary, there was habitat on for the following species:

- Baudin's Black Cockatoo (*Zanda baudinii*), Endangered;
- Carnaby's Black Cockatoo (*Zanda latirostris*), Endangered;
- Forest Red-tailed Black-Cockatoo (*Calyptorhynchus banksii naso*), Vulnerable;
- Coastal Plains Skink (*Ctenotus ora*), Priority 3; and
- Rakal or Water Rati (*Hydromys chrysogaster*), Priority 4

The Rainbow Bee-eater (*Merops ornatus*), listed as Marine, may also be an intermittent visitor to the site but is unlikely to rely on the vegetation for survival.

3.6.4 Impact on Conservation Significant Species

The site has very limited habitat for Baudin's Black Cockatoo, Carnaby's Black Cockatoo and Forest Red-tailed Black-Cockatoo. There is 0.6ha of foraging habitat and limited roosting or potential breeding habitat on the site.

The Referral guideline for 3 WA threatened black cockatoo species indicate that the clearing of 1ha of foraging habitat or one potential breeding habitat tree is to be cleared then the clearing may have a significant impact. If there is to be a significant impact, then referral is required. To determine if there is a significant impact the Department of Climate Change, Energy, the Environment and Water (DCCEEW) require proponents to utilise the *Significant Impact Guidelines 1.1 - Matters of National Environmental Significance* (Significant Impact Guidelines) to undertake a self-assessment of the impact.

The criteria for a significant impact on Critically Endangered and Endangered species are if there is a real chance or possibility that it will:

- Lead to a long-term decrease in the size of a population
- Reduce the area of occupancy of the species
- Fragment an existing population into two or more populations
- Adversely affect habitat critical to the survival of a species
- Disrupt the breeding cycle of a population
- Modify, destroy, remove, isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline
- Result in invasive species that are harmful to a critically endangered or endangered species becoming established in the endangered or critically endangered species' habitat
- Introduce disease that may cause the species to decline, or
- Interfere with the recovery of the species.

The criteria for Vulnerable species are slightly different and are if there is a real chance or possibility that it will:

- Lead to a long-term decrease in the size of an important population of a species
- Reduce the area of occupancy of an important population
- Fragment an existing important population into two or more populations
- Adversely affect habitat critical to the survival of a species
- Disrupt the breeding cycle of an important population

- Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline
- Result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat
- Introduce disease that may cause the species to decline, or
- Interfere substantially with the recovery of the species.

Avoidance and mitigation measures decrease the impact on these species.

Due to the very small area of foraging habitat available to support breeding and low number of potential breeding trees on the site if the entire site was to be cleared it is likely that the self-assessment would conclude that a referral under the EPBC Act is not likely to be required.

The Marine species Rainbow Bee-eater may also be an intermittent visitor to the site but is unlikely to rely on the site for survival and would not be impacted by development.

3.6.5 Pest Fauna

There are several pest species that are likely to be present on the site outlined in Table 8.

Table 8: Pest Species Likely to Occur on the Site

Taxa	Family	Species Name	Common Name
Mammalia	Canidae	Vulpes vulpes	Red fox
	Felidae	Felis catus	Feral cat
	Leporidae	Oryctolagus cuniculus	European Rabbit
	Muridae	Mus musculus	House Mouse
		Rattus rattus	Black Rat

3.6.6 Biodiversity Value

The EPA's (2002) *Terrestrial Biological Surveys as an Element of Biodiversity Protection Position Statement No. 3* indicated an ecological assessment of a site must consider its biodiversity value at the genetic, species and ecosystem levels; and its ecological functional value at the ecosystem level. The vegetation on the site is fragmented with little to no ecological linkage and is disturbed, with the likely presence of feral species such as foxes, cats and rabbits which would have highly modified the fauna assemblage from pre-European settlement.

3.7 Hydrology

3.7.1 Groundwater

The hydrogeology of the area is mapped as fractured rock which comprises a large variety of metamorphic and igneous rocks ranging from the sedimentary rocks to granite-greenstone terrain. At this stage no major aquifers are defined in the fractured rocks (DoW, 2009).

A 12 month groundwater monitoring program was completed for the site as part of the District Water Management Strategy investigations (ENV, 2009). Based on the 12 months monitoring of bores MW1, MW2, MW3, MW4 and DoW Bore 4849 to the east of site the average annual maximum groundwater level (AAMGL) was calculated across the site as shown in Table 9.

Table 9: Maximum Groundwater Levels at Site Bores and DoW Bore 4849 (ENV, 2009)

Bore	Maximum Recorded Groundwater Level (mAHD)	Depth to maximum Recorded Groundwater Level (m)	AAMGL (mAHD)	Depth to AAMGL (m)
MW1	22.273	1.020	22.136	1.157
MW2	21.484	0.248	21.320	0.412
MW3	21.451	1.555	21.314	1.692
MW4	21.173	0.695	21.016	0.852
DoW 4849	14.937	-	14.720	-

Groundwater flow is in a northerly direction towards Adelaide Street.

Groundwater quality sampling was undertaken for bores MW1 to 4 and DoW 4849 on the site and analysed for physical parameters in the field by ENV (ENV, 2009) and analysed by a NATA approved laboratory for nutrients. In summary:

- Groundwater within the site is generally fresh;
- Groundwater is slightly acidic with typical pH values less than 6.25;
- Total Nitrogen (TN) exceeds the ANZECC (2000) guideline of 1.2 mg/L and the Swan Canning Cleanup Program Long Term Target of 1 mg/L ranging from 1.5 mg/L to 3.2 mg/L;
- Total Phosphorus (TP) is below the ANZECC (2000) guideline of 0.065 mg/L in all bores except MW4 where it is 2.75mg/L; and
- The TP is above the Swan Canning Cleanup Program Long Term Target of 0.1 mg/L in all bores on the site (ENV, 2009; Hyd2o, 2012).

The site is not within a Public Drinking Water Source Area (PDWSA) (DWER, 2026). Detailed information on the hydrology of the site is in the Local Water Management Report (LWMR) (Oversby Consulting, 2026).

3.7.2 Surface Water

The site is generally flat to gently sloping. The majority of surface water flows locally towards the creekline that runs through the centre of the site and the lower lying areas on Lot 200. Water flow in the creekline is in a north-westerly direction and feeds into the Perth Airport Northern Drain Catchment. Perth Airport North catchment is monitored in the Swan Canning Water Quality Improvement Plan (Swan River Trust, 2009).

The surface water from the southern corner of the site flows locally towards a lower lying area to the south-west off-site as diffuse overland flow. The surface water flow from the site drains away from Munday Swamp, located to the south-west, and therefore does not impact on the water levels within the swamp.

ENV (2009) undertook surface water monitoring through the central drain bi-monthly for a period of 12 months from July 2008 to May 2009. The maximum recorded level was 21.385m AHD. Detailed information on the hydrology of the site is in the Local Water Management Report (LWMR) (Oversby

Consulting, 2026). There has been no surface water quality sampling undertaken (Oversby Consulting, 2026).

3.8 Wetlands

The site contains eight wetlands (two Resource Enhancement and six Multiple Use) and is adjacent to one wetland as shown in the *Geomorphic Wetlands of the Swan Coastal Plain* Database (Figure 5) (Landgate, 2024b). There is also a creekline through the central part of the site that ultimately flows into Helena River that is also part of the two Resource Enhancement wetlands and one of the Multiple Use wetlands. The wetlands are described in Table 10 and definitions of the management categories are in Table 11.

Table 10: Wetlands Located on the Site

Wetland Classification	Wetland Type	UFI Number	Location
Resource Enhancement	Sumpland	16226	Western part of the creekline drainage line.
Resource Enhancement	Sumpland	15940	Eastern part of the creekline drainage line.
Multiple Use	Sumpland	16225	To the north of the western REW
Multiple Use	Sumpland	15898	Traverses the centre of the northern part site from east to west along the creekline.
Multiple Use	Dampland	15267	South of the creekline.
Multiple Use	Sumpland	15777	Northern part of Lot 200
Multiple Use	Dampland	15779	Central part of Lot 200
Multiple Use	Sumpland	15780	The southern part of Lot 200.

Table 11: Management Categories and Objective for Wetlands

Management Category	General Description	Management Objectives	EPA Management Objectives (EPA, 2008)
Conservation Category Wetland (CCW)	Wetlands which support high levels of attributes and functions.	To preserve wetland attributes and functions through reservation in national parks, crown reserves, state owned land and protection under environmental protection policies.	Highest priority wetlands. Objective is to preserve and protect the existing conservation values of the wetlands through various mechanisms including: • reservation in national parks, • crown reserves and State-owned land, • protection under Environmental Protection Policies, and • wetland covenanting by landowners. No development or clearing is considered appropriate. These are the most valuable wetlands and any activity that may lead to further loss or degradation is inappropriate.

Management Category	General Description	Management Objectives	EPA Management Objectives (EPA, 2008)
Resource Enhancement Wetland (REW)	Wetlands which may have been partially modified but still support substantial ecological attributes and functions.	Priority wetlands. Ultimate objective is for management, restoration and protection towards improving their conservation value. These wetlands have the potential to be restored to conservation category. This can be achieved by restoring wetland structure, function and biodiversity. Protection is recommended through a number of mechanisms.	Priority wetlands. Ultimate objective is to manage, restore and protect towards improving their conservation value. These wetlands have the potential to be restored to Conservation category. This can be achieved by restoring wetland function, structure and biodiversity. Protection is recommended through a number of mechanisms.
Multiple Use Wetland (MUW)	Wetlands with few attributes which still provide important wetland functions	Use development and management should be considered in the context of water (catchment/strategic drainage planning), town (land use) and environmental planning through landcare.	Use, development and management should be considered in the context of ecologically sustainable development and best management practice catchment planning through landcare.

Source: Wetlands of the Swan Coastal Plan Volume 2b (Hill *et al*., 1996) unless otherwise referenced

The two Resource Enhancement wetlands currently mapped on the site were previously identified as a single wetland, Resource Enhancement Wetland (UFI 15898). This earlier mapping extended from the western to the eastern boundary of the site and included the central creekline as well as the wetland areas at either end.

A wetland assessment undertaken by PGV Environmental in 2014 found that the central portion of the previously mapped wetland, associated with the creekline, had significantly reduced ecological values and attributes due to altered geomorphology, historical land use, and the dominance of introduced flora species. Vegetation within this central area was assessed as being in Completely Degraded condition, with no native flora species present and a high abundance of weed species.

The eastern and western sections of the former Resource Enhancement Wetland (UFI 15898) supported vegetation in slightly better condition, with some native species present. However, the understorey in both areas was also assessed as Completely Degraded, with no native vegetation recorded apart from a single sedge species, and a high abundance of weeds. Notably, the Declared Weed *Zantedeschia aethiopica* (Arum Lily) was widespread, and Brazilian Pepper (*Schinus terebinthifolia*) was abundant within the eastern vegetated section.

DBCA reviewed the findings of the assessment and subsequently updated the wetland mapping. This resulted in the delineation of two smaller Resource Enhancement Sumplands—UFI 16226 and UFI 15940—as shown in the current mapping (Figure 5).

Under the *A Methodology for the Evaluation of Wetlands on the Swan Coastal Plain, Western Australia* (Department of Biodiversity, Conservation and Attractions, 2017), the wetlands are unlikely to be reclassified either upward to Conservation or downward to Multiple Use for the following reasons.

For the wetlands to be ungraded to Conservation Category the methodology requires a high degree of naturalness, ecological integrity, and minimal disturbance. In this case:

- Vegetation condition has been impacted by weed invasion.
- The western vegetated portion, while retaining mature *Eucalyptus rudis* and *Melaleuca rhaphiophylla*, shows clear disturbance.
- The eastern vegetated portion supports a dense canopy of *Melaleuca rhaphiophylla* over *Astartea fascicularis* and *Lepidosperma longitudinale*, but overall condition was assessed as Good at best.
- There has been modification to hydrology through excavation works and alteration of the creekline connecting the two wetlands.
- The degree of naturalness, as defined in the methodology, is considered Low.

Given these factors, the wetlands do not meet the higher ecological integrity thresholds typically required for Conservation status.

Conversely, a downgrade to Multiple Use is also unlikely as:

- Wetlands within the Mungala suite and the Southern River complex have been significantly impacted and reduced due to historic and ongoing land use pressures.
- As a result, the subject wetlands score highly for representativeness of geomorphology and vegetation complexes within the regional context.
- The vegetation, while impacted does retain a natural overstorey and therefore has Moderate values as defined under the methodology (DBCA, 2017).
- The wetlands provide habitat supporting fauna during vulnerable life stages (e.g., turtle nesting, tadpole development), indicating functional ecological value.

Given these factors, the wetlands meet higher ecological integrity thresholds than those required for Multiple Use status.

Based on the criteria set out by the 2017 DBCA methodology, the wetlands are appropriately classified as Resource Enhancement Wetlands. Their ecological values, while modified, remain significant within the broader landscape context. It is therefore unlikely that a reassessment under current site conditions would support a change in classification.

The two resource Enhancement wetlands are proposed to be retained with a buffer. Proposed buffer widths are examined and assessed in Section 3.9.

The part of the Creekline that is now mapped as UFI 15898 is categorised as Multiple Use. The functions of this wetland are best described in the context of a watercourse. The management of a watercourse is centred around ensuring water quality and quantity are managed as well as determining an appropriate foreshore. The determination of the foreshore is outlined in Section 3.10.

3.9 Wetland Buffers

3.9.1 Buffer Definitions

3.9.1.1 Separation Distance

EPA Guidance Statement 33 (EPA, 2008) states that wetlands that are to be protected require a minimum 50m buffer distance. This advice applies to Conservation Category wetlands as well as Resource Enhancement wetlands if they are to be retained in a development. There is no scientific rationale to justify why 50m is the minimum setback distance.

The Guidance Statement also says that an alternative to applying the minimum 50m setback is to undertake a site-specific buffer assessment. In determining a setback using site-specific studies the overall setback should be determined by:

- The wetland's values;
- The activities, land uses or development near the wetland, existing and proposed; and
- The threats posed by the adjacent activities, land uses or development.

The WAPC (2005) developed guidelines state that site-specific buffer requirements may be determined and notes that buffering may involve a combination of a setback distance and a physical barrier.

3.9.1.2 Wetland Function Area

The Wetland Function Area is defined in the *Guideline for Development of Wetland Buffer Requirements* (WAPC, 2005) as "*the spatial boundary of the wetland. It normally would include the wetland itself and the wetland vegetation*".

The wetland function area is defined by the wetland values (obligate wetland vegetation, surface saturation or inundation and/or hydric soils). The wetland function area for both wetlands has been delineated in wetland assessments (PGV Environmental, 2012). The wetland function areas are defined by the wetland boundaries mapped in the *Geomorphic Wetlands of the Swan Coastal Plain* dataset, as shown in Figure 5.

3.9.1.3 Role of the Buffer

Wetland buffers are defined as the transition zone between the wetland and the surrounding land use. Buffers are measured from the wetland boundary as mapped in the Geomorphic dataset, confirmed by DBCA.

The role of the wetland buffer is to maintain the ecological processes, values and functions of the wetland and to protect the wetland from potential adverse impacts (EPA, 2008).

Fringing vegetation in buffers may fulfil the following habitat functions:

- Breeding and roosting habitat for birds inhabiting the wetland;
- Dryland habitat during inundation periods for terrestrial species; and
- Cover, feeding and breeding habitat for native fauna.

Because of the completely cleared nature of the buffer, and the existence of fill material the buffer does not currently fulfill any of these functions.

3.9.2 Potential Threats to the Wetland

3.9.2.1 Impact of Clearing on Groundwater Levels

Clearing for development typically gives rise to an increase in groundwater recharge and a decrease in evapotranspiration, leading to a rise in groundwater levels. The magnitude of this rise depends on local factors including the area and type of vegetation cleared. In new residential areas the rise is normally temporary, as progressive establishment of domestic and municipal bores increases groundwater abstraction.

The groundwater catchment for the wetlands has been cleared for many decades, and any groundwater rise attributable to that clearing is likely to have already occurred.

3.9.2.2 Direct Impacts on Vegetation

Potential direct impacts on the REW vegetation include people walking through the wetland vegetation from the Light Industrial development. This is considered highly unlikely as the Paperbark and Bulrush vegetation in the eastern wetland (UFI 15940) wetland is very thick, likely to contain Tiger Snakes as a deterrent to access, and people would need to cross the drain which is inundated for many months of the year. The western wetland (UFI 16226) has a more cleared understorey and therefore could have a higher level of access.

Wetland vegetation in both wetlands can also be inadvertently impacted during construction works resulting in damage to the existing vegetation.

3.9.2.3 Hydrology

Drainage of stormwater can pose a hazard to wetland values by changing the hydrological regime of a wetland, impacting on vegetation and wetland function.

Light Industrial development has the potential to add nutrients and contaminants to surface water in the wetland and groundwater due to activities on the Light Industrial sites and off roads.

3.9.2.4 Weeds

The REWs and associated buffers are currently infested with a number of invasive weeds. Weeds can be spread by wind, animals, humans (on footwear etc.), vehicles and by vegetative growth. Light industrial development is highly unlikely to increase the potential for weeds to spread further in the REW.

3.9.2.5 Fire

Fire can increase with additional human access, however the part of the wetland is already in an exposed site and fire does not appear to have been an issue previously. It is unlikely that the proposed development would increase the fire risk to the wetland vegetation.

3.9.2.6 Rubbish

Edge effects from Light Industrial development on adjacent bushland may include litter (windblown, casual littering and illegal dumping) impacting on wetland vegetation. With the installation of appropriate fencing and the implementation of waste management plans rubbish impacts can be mitigated.

3.9.2.7 Feral Animals

The wetland vegetation is highly likely to already be home to rabbits, mice, rats, feral cats and foxes.

Light Industrial development is unlikely to increase the number of mice, rats, cats and foxes as formal fencing will be provided to the development and each development will have controlled waste management in place.

3.9.2.8 Domestic Pets

Domestic pets are not likely to increase as a result of the light industrial development and therefore will not likely pose an increase threat to the wetland's fauna.

3.9.2.9 Edge Effects

Edge effects on wetlands and other bushland areas in the Perth region have traditionally been managed primarily by separation through the provision of buffers. However, protection against many edge effects can also be provided by other means such as hard edges such as roads, barriers (fences, swales etc.) and surveillance. The most effective protection from edge effects is considered to be a combination of separation and barrier.

3.9.3 Mitigation of Threats to Wetlands

Given that both Resource Enhancement Wetlands have the same threatening processes, similar environmental values, similar Completely Degraded buffers and are linked by the creekline it is considered to be appropriate to apply the same mitigation measures to protect the wetland values to each wetland.

3.9.3.1 Direct Impacts on Vegetation

To prevent people walking through the wetland, a fence should be installed between the development and the wetland buffer.

During construction and removal of fill from the wetland buffer all plans should show the extent of the wetland vegetation as being retained and not to be cleared. The wetland vegetation should be fenced temporarily during construction works to avoid inadvertent damage to the vegetation. Appropriate inductions and plans will ensure that the threat of inadvertent damage to the existing wetland vegetation will be mitigated.

The implementation of a reduced buffer does not increase the impacts of these threats to the wetlands and therefore a 15m buffer is considered appropriate to protect the existing wetland vegetation from direct impacts.

3.9.3.2 Hydrology

The hydrology of the wetland will be maintained using the drainage design system contained in the Local Water Management Strategy. The design will require stormwater is managed to maintain groundwater quality and quantity as well as managing overland flows to ensure that pollutants, both chemical and gross pollutants, are trapped and appropriately managed within the development area.

Drainage design for the development will be undertaken in in accordance with State Planning Policy No. 2.9 *Water* (Government of Western Australia, 2026). Industrial lots are to use biogardens or similar vegetated treatment systems (according to the City) for their stormwater runoff. The industrial roads will also utilise bioretention gardens and be required to incorporate best practice strategies

within their lot boundary to treat stormwater including sediment forebays, oil separators, Gross Pollutant Traps and separated washdown facilities.

Runoff from storms up to 1% Annual Exceedance Probability Event (100 year) attenuated back to allowable discharge rates specified by Perth Airport based on downstream system capacity (Oversby Consulting, 2026).

All drainage from the development will be managed under the Stormwater Management Plan (Oversby Consulting, 2026) with appropriate controls to manage stormwater and ensure there is no adverse impact on the surface water and groundwater quality.

The stormwater controls will be in accordance with:

- Perth Airport systems requirements;
- City of Kalamunda *Stormwater Design Guidelines* (2022);
- State Planning Policy No. 2.9 *Water* (Government of Western Australia, 2026); and
- Principles of Water Sensitive Urban Design (DWER, 2011) (Oversby Consulting, 2026).

Groundwater will be managed to similar levels, so that there is a similar groundwater level within the wetlands, as well as existing inverts of control structures within the wetlands remaining essentially the same, effectively controlling groundwater levels through the wetland and waterway system.

The stormwater controls can be adequately managed within a 15m buffer with stormwater controls outside of the buffer.

3.9.3.3 Weeds

The proposed separation of the wetlands to the development using a hard barrier such as a road or limestone firebreak and 15m of native planting in the buffer will remove the threat of future weed vectors entering the REWs from the current site conditions.

3.9.3.4 Fire

The proposed treatment of the wetland buffer with native sedges will be undertaken in accordance with the Bushfire Management Plan to ensure that risks to wetland vegetation are appropriately mitigated. In addition, the use of planting in conjunction with the installation of a road or fire track along the perimeter of the wetland will provide supplementary fire control infrastructure. No additional buffers are required for the management of fire risks to the wetlands.

3.9.3.5 Rubbish

As part of Development Applications (DA) it is expected that a waste management plan will be required to ensure rubbish from the development is secured and fencing prevents any windblown rubbish from being blown into the wetland areas. The proposed wetland buffer and fence provide more protection from windblown rubbish than is the current situation.

Waste management measures and the fence will provide adequate protection to the wetland with no additional buffer required to mitigate the risk of impacts to the wetland function area from rubbish.

3.9.3.6 Feral Animals

The setback distance would not have any impact on cats, foxes or rabbits impacting on the wetland as these animals can roam over large distances. Appropriate waste disposal will need to be part of the

design of the Light Industrial development to ensure there is not a proliferation of rats and mice. This can be managed by the use of self-closing bins and ensuring that any food waste is managed appropriately. The proposed buffers to the wetland do not require additional distance to mitigate potential impacts from feral animals.

3.9.3.7 Edge Effects

Currently the wetland is not protected by any buffer and is impacted by a number of invasive weeds. The proposed Light Industrial development will include a buffer of 15m of planted vegetation, appropriate fencing to prevent access and a hard edge to reduce weed vectors. The Light Industrial development will also provide a higher level of public surveillance, which will minimise the opportunities for illegal dumping, vehicular access and arson.

It is expected that a 15m buffer and these additional protections to the wetland will effectively protect the wetland from edge effects.

3.9.4 Proposed Wetland Buffer

DBCA typically recommends a default 50 m buffer to wetlands in the absence of site-specific studies. However, where site conditions have been appropriately assessed, buffer requirements may be determined based on environmental values, and buffering may comprise a combination of setback distance and physical barriers.

Analysis of both of the Resource Enhancement wetlands' environmental values and the integrity of the wetlands' core, despite limited existing buffering in the surrounding landscape, indicates that a reduced buffer of 15 m would provide adequate protection of wetland values (Figure 6). The reduced wetland buffer will result in the following outcomes:

- Reinstatement of natural soils by the removal of fill in the wetland buffers;
- Protection from pollutants to the wetland by retaining the 15mm rainfall event in biogardens and sediment forebays, oil separators, Gross Pollutant Traps and separated washdown facilities;
- Provision of controlled surface water flows to the wetland to maintain the hydrological regime;
- Reinstatement of native vegetation within the wetland buffer, improving the condition of the wetland;
- Improved fauna habitat values providing a sedgeland for birds, reptiles and amphibians;
- Management of deleterious impacts such as uncontrolled access, rubbish and feral animals; and
- Reduced weed vectors to the wetland.

The proposed main road through the centre of the Structure Plan Area (Appendix 1) incurs slightly into the 15m buffer in Wetland UFI 16226. The road has been aligned to be consistent with an existing driveway and crossover of the creekline and therefore minimises further disturbance to the waterway. The small decrease in buffer is unlikely to impact on the outcomes for the wetland.

3.10 Creekline Foreshore Assessment

3.10.1 Methodology

The section of the creekline located within Multiple Use Wetland UFI 15898 (Figure 5) exhibits functionality that is more accurately characterised as a watercourse. To determine appropriate setbacks that maintain the values of the watercourse and enhance its environmental attributes, a foreshore assessment was undertaken for this feature within the Structure Plan area.

The foreshore assessment includes database searches to obtain information about the creekline. The following were investigated:

- Review of flora and vegetation studies previously undertaken;
- Site specific field assessment of the creekline and foreshore;
- Historical aerial photographs were examined for evidence of any modifications to the banks or floodway for the creekline (Landgate, 2025a);
- Cultural heritage values from the Department of Planning Lands and Heritage (DPLH) Aboriginal Cultural Heritage Inquiry System specific to the creehline (DPLH, 2025);
- Soil mapping by the Department of Primary Industries and Resource Development (DPIRD) NRMInfo (DPIRD, 2025); and
- Groundwater attributes as undertaken for the LWMR (Oversby Consulting, 2024).

The field assessment was undertaken by PGV Environmental on 7 July 2025. The site survey included a thorough examination of the site.

3.10.2 Historic Creekline Condition

The Creekline on the site originates from drainage on the eastern boundary and flows from east to west at 22mAHD, flowing to the west to an elevation of 20mAHD (Figure 2). The Creekline has been highly modified for more than 60 years. In the aerial photograph from 1965 most of the creekline has been cleared (Plate 5).

A review of historical photography and anthropogenic remains on the site show the wetland areas have been highly disturbed. The flatter wetland areas have been used for grazing. The drainage line of the mapped wetland has been modified extensively.

The earliest aerial photography available is from 1953 (Landgate, 2014a) and shows the wetland has been partially cleared at this early date (Plate 6).

Plate 6: Aerial Photograph of Creekline from 1953 (Landgate, 2025a)

In aerial photography from 1985 the creekline appears to be modified further with the drainage line being deepened through excavation (Plate 7).

Plate 7: Aerial Photograph of Creekline from 1985 (Landgate, 2025a)

The drainage line has been significantly modified by excavation and fill has been added to the site over areas of the wetland (Plate 8). There are areas of fill along the creekline (Plate 9).

Plate 8: Excavated Area

Plate 9: Anthropogenic Fill

The incorporation of fill over much of the wetland area has altered the topography and drainage over the mapped wetland area.

3.10.3 Vegetation

The vegetation in the creekline is in mostly Degraded to Completely Degraded condition with a small area at the eastern end rated as Degraded to Good and the fringing areas are generally Completely Degraded and Degraded (Figure 4).

3.10.4 Watercourse Hierarchy

The creekline flows westward to the boundary of the Structure Plan area and water is then piped underground. The creekline is rated as a first order tributary as there are no other smaller tributaries flowing into the creekline downstream from the site (DPE, 2022).

3.10.5 Cross Sections

The bed and banks of the creekline have been highly modified and as such the grade of the banks, distance between the top of banks and width of the creekline is variable. The cross sections of the creekline are described in Table 12. The locations are shown on Plate 10.

Plate 10: Locations for Foreshore Assessment

Table 12: Creekline and Foreshore Assessment

Location	Bed	Banks	Landform Condition	Vegetation	Photographs
1	Shallow bed approximately 5-10m wide	Banks are modified due to excavation	Sandy soil and impacted by grazing. No slumping evident	MrAf - *Melaleuca rhaphiophylla/Astartea fascicularis* Thicket to Low Woodland. Area of foreshore cleared with some native sedges	

Location	Bed	Banks	Landform Condition	Vegetation	Photographs
2	Narrow bed approximately 5m wide	Banks narrowly incised due to excavation	Banks impacted by grazing but no obvious slumping or erosion	Creekbed contains some *Melaleuca rhaphiophylla* with weeds and is Degraded. Foreshore cleared and Completely Degraded	
3	The channel in this area has a bed approximately 10m wide	This area is more shallowly incised.	Banks impacted by grazing but no obvious slumping or erosion	ErMr *Eucalyptus rudis* Woodland to Low Forest over *Melaleuca rhaphiophylla* Low Forest over Arum Lily and is Degraded. Foreshore cleared and Completely Degraded	

The creekline is highly modified by excavation, clearing and fill and shows the impact of grazing. The vegetation in the creekline is Degraded to Completely Degraded (Figure 4). The fringing vegetation is mostly Completely Degraded with areas of fill and very little vegetation.

The stability of the banks of the creekline is assessed as being Moderate:

> *Some localised erosion, slumping and sediment deposits; native vegetation cover on verges may be patchy and interspersed with patches of exposed soil* (WRC, 1999).

The rating is mainly due to the presence of fringing vegetation along most of the banks with only a few occurrences of erosion impacting on the vegetation. The vegetation in the creekline and foreshore is considered to be Poor, defined as:

> *Modified vegetation structure with native plants comprising only (2 points) 20 - 50% of the total species composition. Trees remain with only scattered shrubs and an understorey dominated by weeds; prevalent disturbance* (WRC, 1999).

3.10.6 Living Stream

The degraded condition of the existing creekline provides an opportunity to modify sections of the watercourse and realign flows into a proposed living stream. The design builds on the current hydrological function of the site, where both the wetland areas and the open drain convey flows, while also providing storage and water treatment.

The degraded open drain will be partially rerouted to improve the overall site layout and to facilitate the establishment of a more naturalised drainage corridor that supports both stormwater management and ecological enhancement. Earthworks associated with the proposed living stream will create a relatively weed-free channel that can be revegetated with appropriate riparian species, while maintaining hydraulic capacity.

3.10.7 Floodplain Mapping

Floodplain mapping undertaken for the LWMR shows the 10% AEP is 11m wide for the length of the creekline (Oversby Consulting, 2026). The 1% AEP is 13m wide, due to the flattening of the banks (Oversby Consulting, 2026) (Appendix 8).

3.10.8 Foreshore Setback

The creekline is considered to be a waterway, rather than a basin type of wetland and, as such, management of the waterway is administered by DWER rather than DBCA. Waterways do not have a minimum setback such as the 50m setback that exists with basin type wetlands. Waterways require a foreshore area between a proposed development and the waterway primarily to protect the creekline ecology but also to protect any fringing vegetation and habitat that is important to the waterway and to prevent flooding of adjoining areas. A foreshore area can also provide public recreational amenity and potentially have a stormwater drainage function. The foreshore to the creekline is largely devoid of any vegetation, planted or native past the immediate area to the creekline.

There are several guidance documents to assist with determining an appropriate setback as follows:

- *Planning and Management Foreshore condition assessment in urban and semi-rural areas of south-west Western Australia* (WRC, 1999);
- Operation Policy 4.3: *Identifying and establishing waterways foreshore areas* (DoW 2012);
- Guidance Note 6: *Identifying and establishing waterways foreshore areas* (DoW 2013); and
- Water Note 23: *Determining foreshore reserves* (WRC 2001).

First order streams are generally recommended to have a total width of 20m plus the channel. The channel width is approximately 1.4m at the base of the channel and then has a main with of 11m. This would result in a total foreshore width of 41m (Figure 6). This generic width can then be considered in the context of multiple factors such as the biophysical conditions of the streamline, and the nature of the management requirements.

The biophysical criteria used to determine an appropriate setback are assessed in Table 13 for consideration when identifying a foreshore area (WRC 2001).

Table 13: Biophysical Criteria and Assessment

Biophysical Factor	Assessment of Factor	Spatial Implications for Setback
Vegetation	The wetland vegetation is mainly along the creekline made up of planted and native species that is all Degraded to Completely Degraded. There is no native vegetation on the remainder of the site away from the creek.	All wetland vegetation to be retained. No dryland vegetation needs to be retained due to its absence on the site. Therefore, setback not determined by site vegetation characteristics.
Hydrology	The creekline is mainly a narrow, shallowly incised central creek and a flat, broad floodplain that is partially waterlogged and inundated in winter/spring.	The setback width to the waterway will not affect the hydrological function of the creekline and floodplain.
Topography	The land adjoining the creekline is flat to moderately sloping and impacts on the foreshore area.	The foreshore setback should maintain the current topography. It is recommended that a reserve containing the 1%AEP would be adequate.
Soil Type	The soils are Pinjarra, Ya2 Phase (213Pj_Ya2) is located on plain and swamp margins with deep, poorly drained, grey siliceous sand overlying clay.	No spatial implications
Erosion	The narrow, shallowly incised central creekline have potential for erosion to occur so all existing vegetation should be retained	No spatial implications
Function	Function is flood conveyance to the Perth Airport Northern Drain Catchment	Water conveyance function not impacted by foreshore setback width
Habitat	Habitat is highly impacted and the current foreshore does not provide significant habitat values	No fringing dryland vegetation present that needs to be retained in a foreshore reserve. Therefore setback width not impacted.

Biophysical Factor	Assessment of Factor	Spatial Implications for Setback
Land Use	The creekline and foreshore previously used for agriculture but this will be ceased when the surrounding land use is changed is not used and dryland area not used	The future function of the foreshore area will likely include some passive recreational value such as a pathway parallel with the creekline.

The primary factor in determining a suitable setback from the creekline/stream is the generally Completely Degraded condition of the foreshore and lack of native vegetation. Management of stormwater in accordance with State Planning Policy No. 2.9 *Water* (Government of Western Australia, 2026) will maintain water quality by retaining and treating first flush events while ensuring that the hydrological regime and overland flows to replenish the creekline are maintained. There are no factors identified that would warrant increasing the proposed foreshore so the total stream and foreshore width of 41m is considered to be adequate to protect and enhance the creekline environmental values.

4 ENVIRONMENTAL ASSESSMENT

4.1 Proposed Development

The proposal is to develop the site for Light Industrial purposes. The site is likely to be largely cleared with the exception of the vegetation associated with the creekline. The creekline may be rehabilitated to improve the ecological linkage it provides. Additionally formalising stormwater controls to manage runoff into the creekline will occur with the implementation of the Local Water Management Strategy in accordance with State Planning Policy No. 2.9 *Water* (Government of Western Australia, 2026) and . Mature trees should be retained where possible.

4.2 Land Use

The site has historically been mostly cleared and is not listed as a Contaminated Site. The past and present land use on the site is not considered a constraint to development.

4.3 Geology and Soils

The Pinjarra Plain System soils are not a constraint for development. There are similar developments on these land units in the surrounding area.

The soils mapped on the site have a high risk of being susceptible to wind erosion and therefore dust controls will be required during construction. Wind erosion risk will be minimised once the site is fully developed as the ground disturbing activities have been completed.

There is an acid sulphate soil risk as mapped over the site. WAPC *Acid Sulphate Soils Planning Guidelines* (WAPC, 2009) indicate that "*acid sulphate soils are technically manageable in the majority of cases*" which would be applicable to the site. ASS Investigation and, if required, Management Plans should be prepared once the detailed design of soil disturbance on the site is finalised. This should be undertaken in accordance with the *Acid Sulphate Soils Guideline Series: Identification and Investigation of Acid Sulphate Soils and Acidic Landscapes* (DER, 2015a) and *Treatment and Management of Soils and Water in Acid Sulphate Soil Landscapes* (DER, 2015b).

The soils on the site do not provide an environmental impediment to the development of the site.

4.4 Hydrology

Groundwater will be managed to similar levels, so that there is a similar groundwater level within the wetlands, as well as existing inverts of control structures within the wetlands remaining essentially the same, effectively controlling groundwater levels through the wetland and waterway system.

Stormwater management will be required to be addressed in accordance with State Planning Policy No. 2.9 *Water* (Government of Western Australia, 2026). An Urban Water Management Plan will be required at the subdivision stage. All lots will be required to use biogardens or similar vegetated treatment systems (according to the City) for their stormwater runoff as well as best practice strategies within their lot boundary to treat stormwater including sediment forebays, oil separators, Gross Pollutant Traps and separated washdown facilities.

Water management will be guided by the Local Water Management Report (Oversby Consulting, 2026). Management measures as per the LWMR are outlined below:

Water Conservation and Servicing

- *All lots are to be connected to a potable reticulated water main to provide security of supply.*
- *All residential lots are to be connect to mains sewerage.*
- *All residential lots are to utilise suitable on site effluent management.*
- *The Living Stream landscaping is to be primarily irrigated via stormwater and the shallow natural groundwater.*
- *The residential POS areas may receive irrigation*

Stormwater management

- *All new residential lots will detain and infiltrate the 5% AEP on site, as per the City of Kalamunda's guidelines.*
- *All new industrial lots will detain and infiltrate stormwater so that there 1% AEP runoff is in keeping with the requirements of the downstream Perth Airport drainage network.*
- *Bioretention systems and/or soakwells assist with treatment of stormwater with the new road networks.*
- *The Living Stream and retained Wetlands assist with treatment and detention of stormwater from the subject land and upstream catchments.*
- *The Southern POS basin will retain and infiltrate stormwater discharged into it.*
- *The lot detention, POS basins and Living Stream/ Wetland network detain all peak flows to at/below pre development rates as well as meeting the Perth Airport discharge rate.*

Flood management

- *All lot levels will be designed to maintain a minimum separation clearance of 300mm between the habitable floor levels and the 1% Annual Exceedance Probability (AEP) flood levels generated on site.*
- *All lot levels will be designed to maintain a minimum separation clearance of 500mm between the habitable floor levels and the 1% Annual Exceedance Probability (AEP) flood levels of the Living Stream and main POS detention basin.*
- *The Living Stream and wetland network allows for 1% AEP flood flows to traverse the subject land site as well as providing safe storage.*

Groundwater Management

- *Inflow to the groundwater is to be treated in bioretention gardens and Living Stream/wetland network.*
- *Where necessary the subject land is to be lifted using clean fill to maintain necessary separation to the groundwater.*
- *Subsoil systems are to be installed to control groundwater rise in areas with groundwater less than 1.5m from the surface.*
- *Mains sewerage will remove potential pollutants from the residential lots for treatment off site.*

- *Removal of stock and large gardens is likely to reduce nutrient loads to the groundwater.*

Ecosystem Protection and Enhancement

- *The stormwater system will assist with capturing sediments, large debris, nutrients and other pollutants from all stormwater runoff, protecting the subject land wetlands.*
- *New riparian ecosystems creation will be undertaken through converting the current degraded drainage line into a Living Stream.*
- *Bioretention systems will provide some limited habitat to fauna throughout the subject land.*
- *The wetlands are to be enhanced through weed control and revegetation as well as being protected in reserves with appropriate buffers* (Oversby Consulting, 2026).

The management of stormwater is not considered a constraint to development.

4.5 Flora and Vegetation

The flora and vegetation on the site has been significantly impacted by historical clearing. The proposed development would not result in conservation significant flora and vegetation being impacted. The vegetation on the site is mostly Degraded and therefore the proposed development will not impact on locally or regionally significant vegetation and there is no impact on any Threatened or Priority Ecological Community.

4.6 Fauna

The fauna habitat values have been impacted by the extensive historical clearing on the site and as such the proposed development would have very little impact on native fauna habitat. Impacts to Black Cockatoos are likely to not be significant however the retention of trees within the proposed development would mitigate some of the habitat loss.

A Fauna Management Plan should be prepared prior to clearing, including the trapping and relocation of both common and potential conservation significant species present on the site.

4.7 Heritage

There is an Aboriginal Cultural Heritage Site mapped on the site. Advice should be sought to determine obligations under the *Aboriginal Heritage Act 1972.* The sites are mapped over a large area and there are numerous developments, recent and ongoing in the area so the heritage site is not likely to be a constraint to development.

The identification of materials that may constitute an archaeological site, if identified during earthworks, would be required to comply with the *Aboriginal Heritage Act, 1972* regarding such sites.

4.8 Wetlands

4.8.1 Wetland Development/Retention

The management of wetlands within the Structure Plan area will be undertaken in accordance with the Local Water Management Report (LWMR), as outlined in Section 4.4. Several scenarios were explored during the Structure Plan design process.

A review was undertaken to determine whether the wetland values and attributes were commensurate with the existing mapping and classification on the site, or whether the wetlands were so degraded that they were no longer viable and could be included within the developable envelope.

Five of the Multiple Use Wetlands on the site were classified as being commensurate with Multiple Use values and were considered to have development capabilities. These wetlands are:

- Multiple Use Sumpland (UFI 16225);
- Multiple Use Dampland (UFI 15267);
- Multiple Use Sumpland (UFI 15777);
- Multiple Use Dampland (UFI 15779); and
- Multiple Use Sumpland (UFI 15780).

Multiple Use Sumpland (UFI 15898) is classified as Completely Degraded and was considered to be appropriately classified, except where the wetland forms part of the creekline that traverses the property and ultimately drains to the Helena River (ENV Australia, 2009). The creekline retains hydrological value and ecological function; however, this does not warrant an upgrade to the wetland management category.

The two Resource Enhancement wetlands have recently been assessed by the Department of Biodiversity, Conservation and Attractions (DBCA) and are considered to be accurately mapped and categorised. Accordingly, it is unlikely that the management category of these wetlands would be downgraded, and development within these wetlands is not considered appropriate.

As the classification of all wetlands on the site is considered accurate, it is not expected that any wetland management category would be upgraded in their current condition. The buffers and foreshore setbacks to the wetlands and creekline are classified as Completely Degraded and are characterised by anthropogenic fill, invasive weeds, and cleared paddock areas.

Management of the wetlands, creekline, buffers, and foreshore areas will include the removal of Declared Pests, management of invasive weeds, rehabilitation of disturbed areas, and improvements to water quality through the management of first-flush stormwater events. Over time, these measures may result in the wetland values becoming more commensurate with Conservation Category Wetlands.

The improvement in wetland values is considered to mitigate the impact of development within the Multiple Use wetlands elsewhere on the site. As the preservation and management of the wetlands provides mitigation for the onsite impacts it would not be considered an appropriate offset for projects undertaken in surrounding areas.

4.8.2 Wetland Buffers

The wetland buffers are Completely Degraded and have been significantly altered. Management of the threats to the wetland should be undertaken using a number of measures including:

- Management during civil works such as erosion control, soil stockpile management, protection of the creekline to prevent erosion, slumping and sedimentation;
- Access control using fencing and paths;
- Reinstation natural landform in areas that have fill.

- Management of the hydrology of the wetlands using the drainage design system contained in an approved Urban Water Management Plan including:
  - Hardstand runoff from the first 15mm of rainfall will be managed via biofiltration systems to provide water quality treatment of small events prior to off-site discharge.
  - Runoff from storms up to 1% Annual Exceedance Probability Event (100 year) will be detained within lots;
  - Maintenance of the predevelopment catchments and discharge locations to maintain the existing hydrological interface with the adjacent REW.
  - The stormwater controls should be in accordance with, but not limited to:
    - Perth Airport systems requirements;
    - City of Kalamunda *Stormwater Design Guidelines* (2022);
    - State Planning Policy No. 2.9 *Water* (Government of Western Australia, 2026); and
    - Principles of Water Sensitive Urban Design (DWER, 2011).
- Weed control programs in the wetlands to management invasive weeds and Declared pests
- Provide adequate fire breaks to development; and
- Appropriate waste disposal/waste management plans as part of the design of the Light Industrial development to ensure there is not a proliferation of rats and mice, including self-closing bins and ensuring that any food waste is managed appropriately.

The proposed Structure Plan provides for 15m buffers surrounded by defined hard edges to protect the wetlands. There is a small area in which the buffer is proposed to be lightly reduced to utilise an existing road and crossover of the creekline for a main road through the Structure Plan area (Appendix 1).

The assessment demonstrates that the proposed removal of fill and revegetation within the proposed buffer as shown on Figure 6 will not only suitably protect the wetland's ecological functions but will also result in improved protection and enhanced ecological values. This outcome will be further supported by appropriate stormwater management measures designed to improve water quality, the installation of fencing to restrict access and function as a gross pollutant trap, and the provision of a defined hard edge to the wetland (such as a road or limestone fire track). Collectively, these measures provide an integrated approach to wetland protection.

Overall, the assessment concludes that the proposed 15 m buffer, together with the management measures incorporated into the Structure Plan, will suitably protect the wetland's ecological functions.

4.8.3 Wetland Treatment

In summary the wetlands as mapped on the site have the following recommendations as outlined in Table 14.

Table 14: Proposed Treatment of Wetlands in Structure Plan

Wetland Classification	Wetland Type	UFI Number	Location	Relevant Values	Retain (Yes/No)	Buffer/ Foreshore and Management Recommendation
Resource Enhancement	Sumpland	16226	Western side of the site.	Vegetation in Good condition and is also part of the creekline	Yes	15m buffer and then fencing and a hard edge to provide integrated management measures with weed management, rehabilitation and stormwater management
Resource Enhancement	Sumpland	15940	Eastern part of the creekline drainage line.	Vegetation in Good condition and is also part of the creekline	Yes	
Multiple Use	Sumpland	16225	To the north of the western REW	Vegetation is Completely Degraded	Yes – in buffer	Forms part of the 15m buffer to REW 16226
Multiple Use	Sumpland	15898	Traverses the centre of the northern part site from east to west along the creekline.	Vegetation is completely Degraded but is part of the creekline that ultimately flow to Helena River so needs to be managed to ensure there are no downstream impacts	Yes – in part along the creekline	To be treated as a watercourse with a 15m buffer to the 11m main channel for a total width of 41m that contains the 10% AEP with integrated management measures of fencing, a hard edge, rehabilitation and stormwater management consistent with the Resource Enhancement wetlands
Multiple Use	Dampland	15267	South of the creekline.	Cleared and filled in parts. Completely Degraded	No	NA
Multiple Use	Sumpland	15777	Northern part of Lot 200	Already cleared and filled	No	NA
Multiple Use	Dampland	15779	Central part of Lot 200	Already cleared and filled	No	NA
Multiple Use	Sumpland	15780	The southern part of Lot 200.	Already cleared and filled	No	NA

4.8.4 Living Stream

The creekline through the site has been degraded over many years, with sections of the channel highly modified and only limited riparian vegetation remaining. The proposed living stream has been designed to maintain hydraulic connectivity between the wetlands and ultimately convey flows to the Perth Airport Northern Drain catchment, while consolidating the existing drainage function and ensuring sufficient capacity to accommodate stormwater flows.

The design also incorporates measures to enhance both hydraulic performance and ecological value, including the establishment of riparian vegetation and the introduction of features such as minor meanders, rock boulders, pools and riffles.

4.8.5 Foreshore Reserve

The combined width of the channel of the living stream and proposed foreshore, totalling 41m of POS as shown on Figure 6, aligns with the proposed 15m wetland buffer widths, thereby providing continuity of environmental setbacks across the proposed development. The 41m corridor incorporates the 1% Annual Exceedance Probability (AEP) flood extent, together with an additional 9m on either side of the 1% AEP level.

The foreshore will be enhanced through native planting on the banks of the channel to improve bank stabilisation and provide additional protection to the waterway. Consistent with the wetland treatment, the creekline is expected to be fenced and bounded by a defined hard edge, such as a road or fire track. These measures will mitigate potential impacts associated with uncontrolled access, rubbish dumping, weed spread and edge effects.

In addition, the measures previously outlined and incorporated into the LWMR will ensure that both water quality and water quantity are appropriately managed, resulting in a positive downstream outcome.

5 SUMMARY AND CONCLUSIONS

5.1 Summary

The Environmental Assessment of the proposed Light Industrial Development of the Hatch Court Precinct has found the following:

- The historic and current land-uses on the site are not a constraint to develop the site in accordance with the Structure Plan;
- There are no Aboriginal Heritage sites or sites of other heritage values on the site;
- The soils mapped on the site are not a constraint to development. Soil types with a high to extreme wind erosion risk can be managed for dust control during construction through the preparation and implementation of a Dust Management Plan;
- Acid Sulphate Soil investigation and Management may be required;
- There are no Threatened or Priority flora species occurring on the site and therefore flora is not a constraint to development;
- The vegetation on the site is mostly Degraded and is not representative of a Threatened or Priority Ecological Community and the vegetation is not considered to be a constraint to the proposed development;
- The site contains some trees which provide foraging habitat and potential breeding habitat for Baudin's, Carnaby's and Forest Red-tailed Black Cockatoos. Clearing is unlikely to have a significant impact and a referral under the EPBC is not likely to be required;
- The development will maintain ecological linkage through the east-west creekline;
- Development will provide additional protection from potential contaminants from first flush event by installing appropriate stormwater controls in accordance with the LWMS while maintaining the hydrological regime of overland flow to the creekline in higher rainfall events;
- The Resource Enhancement wetlands and creekline have been individually assessed to determine appropriate buffers and foreshore setbacks;
- A 15m buffer to the wetlands combined with fencing around the buffers and a hard edge such as a road or fire track, supported by appropriate stormwater management measures designed to improve water quality, collectively provide an integrated approach to wetland protection which will result in the enhancement of the wetland values;
- Rehabilitation and ongoing weed control may result in improvements to wetland condition such that the wetlands develop attributes more representative of Conservation Category Wetlands.;
- The foreshore reserve width of 15m foreshore on each side of the 11m channel width as determined by the 10% AEP to a total of 41m provide adequate protection to the creekline and maintains the continuity of management of wetlands and the waterway across the development;
- The creekline and foreshore are in Degraded to Completely Degraded condition, so the degraded creekline will be partially reconfigured to a living stream to ensure the creekline has enhanced water capacity for stormwater and improved environmental values and ecological function; and

- Implementation of foreshore management and rehabilitation measures within the foreshore to the creekline/living stream will improve the environmental function of the watercourse.

The considerations for the design of the development include rehabilitation of the Resource Enhancement Wetlands, living stream and associated buffers and foreshore to improve the ecological linkage it provides. Additionally formalising stormwater controls to manage runoff into the creekline in accordance with State Planning Policy No. 2.9 *Water* (Government of Western Australia, 2026). Mature trees should be retained where possible.

5.2 Conclusion

The Environmental Assessment of the Hatch Court Light Industrial Precinct concludes that development of the site is not constrained by any environmental factor.

Additional management and detailed management plans to address the following factors will be required in future stages:

- Rehabilitation and management of the creekline and wetlands;
- Tree retention strategy;
- Urban Water Management Plans in accordance with *SPP2.9* ;
- If required further investigation and possibly management for Acid Sulphate Soils;
- Fauna management and relocation plans; and
- Dust Management Plans.

- Degraded
- Completely Degraded
- Cleared

Vegetation Condition
(SOURCE: Bush Forever, Govt. of W.A., 2000)

P - Pristine
Pristine or nearly so, no obvious signs of disturbance.

Ex - Excellent
Vegetation structure intact, disturbance affecting individual species and weeds are non aggressive species.

VG - Very Good
Vegetation structure altered, obvious signs of disturbance. For example, disturbance to vegetation structure caused by repeated fires, the presence of some more aggressive weeds, dieback, logging and grazing.

G - Good
Vegetation structure significantly altered by very obvious signs of multiple disturbance. Retains basic vegetation structure or ability to regenerate it. For example, disturbance to vegetation structure caused by very frequent fires, the presence of some very aggressive weeds at high density, partial clearing, dieback and grazing.

D - Degraded
Basic vegetation structure severely impacted by disturbance. Scope for regeneration but not to a state approaching good condition without intensive management. For example, disturbance to vegetation structure caused by very frequent fires, the presence of very aggressive weeds, partial clearing, dieback and grazing.

CD - Completely Degraded
The structure of the vegetation is no longer intact and the areas is completely or almost completely without native species. These areas are often described as 'parkland cleared' with the flora composing weed or crop species with isolated native trees or shrubs.

Cl - Cleared
No native vegetation remaining.

Disclaimer

Aboriginal heritage holds significant value to Aboriginal people for their social, spiritual, historical, scientific, or aesthetic importance within Aboriginal traditions, and provides an essential link for Aboriginal people to their past, present and future. In Western Australia Aboriginal heritage is protected under the *Aboriginal Heritage Act 1972*.

All Aboriginal cultural heritage in Western Australia is protected, whether or not the ACH has been reported or exists on the Register.

The information provided is made available in good faith and is predominately based on the information provided to the Department of Planning, Lands and Heritage by third parties. The information is provided solely on the basis that readers will be responsible for making their own assessment as to the accuracy of the information. If you find any errors or omissions in our records, including our maps, it would be appreciated if you provide the details to the Department via https://achknowledge.dplh.wa.gov.au/ach-enquiry-form and we will make every effort to rectify it as soon as possible.

South West Settlement ILUA Disclaimer

Your heritage enquiry is on land **within or adjacent to** the following Indigenous Land Use Agreement(s): Whadjuk People Indigenous Land Use Agreement.

On 8 June 2015, six identical Indigenous Land Use Agreements (ILUAs) were executed across the South West by the Western Australian Government and, respectively, the Yued, Whadjuk People, Gnaala Karla Booja, Ballardong People, South West Boojarah #2 and Wagyl Kaip & Southern Noongar groups, and the South West Aboriginal Land and Sea Council (SWALSC).

The ILUAs bind the parties (including 'the State', which encompasses all State Government Departments and certain State Government agencies) to enter into a Noongar Standard Heritage Agreement (NSHA) when conducting Aboriginal Heritage Surveys in the ILUA areas, unless they have an existing heritage agreement. It is also intended that other State agencies and instrumentalities enter into the NSHA when conducting Aboriginal Heritage Surveys in the ILUA areas. It is recommended a NSHA is entered into, and an 'Activity Notice' issued under the NSHA, if there is a risk that an activity will ‘impact’ (i.e. by excavating, damaging, destroying or altering in any way) an Aboriginal heritage site. The Aboriginal Heritage Due Diligence Guidelines, which are referenced by the NSHA, provide guidance on how to assess the potential risk to Aboriginal heritage.

Likewise, from 8 June 2015 the Department of Energy, Mines, Industry Regulation and Safety (DEMIRS) in granting Mineral, Petroleum and related Access Authority tenures within the South West Settlement ILUA areas, will place a condition on these tenures requiring a heritage agreement or a NSHA before any rights can be exercised.

If you are a State Government Department, Agency or Instrumentality, or have a heritage condition placed on your mineral or petroleum title by DEMIRS, you should seek advice as to the requirement to use the NSHA for your proposed activity. The full ILUA documents, maps of the ILUA areas and the NSHA template can be found at https://www.wa.gov.au/organisation/department-of-the-premier-and-cabinet/south-west-native-title-settlement.

Further advice can also be sought from the Department of Planning, Lands and Heritage via https://achknowledge.dplh.wa.gov.au/ach-enquiry-form.

Copyright

Copyright in the information contained herein is and shall remain the property of the State of Western Australia. All rights reserved. This includes, but is not limited to, information from the Register established and maintained under the *Aboriginal Heritage Act 1972*.

WALIA does not warrant the accuracy or completeness of the location information data or its suitability for any particular purpose.

Terminology

ID: ACH on the Register is assigned a unique ID by the Department of Planning, Lands and Heritage using the format: ACH-00000001. For ACH on the former Register the ID numbers remain unchanged and use the new format. For example the ACH ID of the place Swan River was previously '3536' and is now 'ACH-00003536'.

Access and Restrictions:

- **Boundary Reliable (Yes/No):** Indicates whether to the best knowledge of the Department, the location and extent of the ACH boundary is considered reliable.
- **Boundary Restricted = No:** Represents the actual location of the ACH as understood by the Department..
- **Boundary Restricted = Yes:** To preserve confidentiality the exact location and extent of the place is not displayed on the map. However, the shaded region (generally with an area of at least 4km²) provides a general indication of where the ACH is located. If you are a landowner and wish to find out more about the exact location of the place, please contact the Department of Planning, Lands and Heritage.
- **Culturally Sensitive = No:** Availability of information that the Department of Planning, Lands and Heritage holds in relation to the ACH is not restricted in any way.
- **Culturally Sensitive = Yes:** Some of the information that the Department of Planning, Lands and Heritage holds in relation to the ACH is restricted if it is considered culturally sensitive information. This information will only be made available if the Department of Planning, Lands and Heritage receives written approval from the people who provided the information. To request access please contact via https://achknowledge.dplh.wa.gov.au/ach-enquiry-form.
- **Culturally Sensitive Nature:**
  - **No Gender / Initiation Restrictions:** *Anyone* can view the information.
  - **Men only:** Only *males* can view restricted information.
  - **Women only:** Only *females* can view restricted information.

Status:

- **Register:** Aboriginal cultural heritage places that are assessed as meeting Section 5 of the *Aboriginal Heritage Act 1972*.
- **Lodged:** Information which has been received in relation to an Aboriginal cultural heritage place, but is yet to be assessed under Section 5 of the *Aboriginal Heritage Act 1972.*
- **Historic:** Aboriginal heritage places assessed as not meeting the criteria of Section 5 of the *Aboriginal Heritage Act 1972*. Includes places that no longer exist as a result of land use activities with existing approvals.

Place Type: The type of Aboriginal cultural heritage place. For example an artefact scatter place or engravings place.

Legacy ID: This is the former unique number that the former Department of Aboriginal Sites assigned to the place.

Coordinates

Map coordinates are based on the GDA 2020 Datum.

South West Settlement ILUA Disclaimer

Your heritage enquiry is on land **within or adjacent to** the following Indigenous Land Use Agreement(s): Whadjuk People Indigenous Land Use Agreement.

On 8 June 2015, six identical Indigenous Land Use Agreements (ILUAs) were executed across the South West by the Western Australian Government and, respectively, the Yued, Whadjuk People, Gnaala Karla Booja, Ballardong People, South West Boojarah #2 and Wagyl Kaip & Southern Noongar groups, and the South West Aboriginal Land and Sea Council (SWALSC).

The ILUAs bind the parties (including 'the State', which encompasses all State Government Departments and certain State Government agencies) to enter into a Noongar Standard Heritage Agreement (NSHA) when conducting Aboriginal Heritage Surveys in the ILUA areas, unless they have an existing heritage agreement. It is also intended that other State agencies and instrumentalities enter into the NSHA when conducting Aboriginal Heritage Surveys in the ILUA areas. It is recommended a NSHA is entered into, and an 'Activity Notice' issued under the NSHA, if there is a risk that an activity will ‘impact’ (i.e. by excavating, damaging, destroying or altering in any way) an Aboriginal heritage site. The Aboriginal Heritage Due Diligence Guidelines, which are referenced by the NSHA, provide guidance on how to assess the potential risk to Aboriginal heritage.

Likewise, from 8 June 2015 the Department of Energy, Mines, Industry Regulation and Safety (DEMIRS) in granting Mineral, Petroleum and related Access Authority tenures within the South West Settlement ILUA areas, will place a condition on these tenures requiring a heritage agreement or a NSHA before any rights can be exercised.

If you are a State Government Department, Agency or Instrumentality, or have a heritage condition placed on your mineral or petroleum title by DEMIRS, you should seek advice as to the requirement to use the NSHA for your proposed activity. The full ILUA documents, maps of the ILUA areas and the NSHA template can be found at https://www.wa.gov.au/organisation/department-of-the-premier-and-cabinet/south-west-native-title-settlement.

Further advice can also be sought from the Department of Planning, Lands and Heritage via https://achknowledge.dplh.wa.gov.au/ach-enquiry-form.

WALIA does not warrant the accuracy or completeness of the location information data or its suitability for any particular purpose.

Terminology

ID: ACH on the Register is assigned a unique ID by the Department of Planning, Lands and Heritage using the format: ACH-00000001. For ACH on the former Register the ID numbers remain unchanged and use the new format. For example the ACH ID of the place Swan River was previously '3536' and is now 'ACH-00003536'.

Access and Restrictions:

- **Boundary Reliable (Yes/No):** Indicates whether to the best knowledge of the Department, the location and extent of the ACH boundary is considered reliable.
- **Boundary Restricted = No:** Represents the actual location of the ACH as understood by the Department..
- **Boundary Restricted = Yes:** To preserve confidentiality the exact location and extent of the place is not displayed on the map. However, the shaded region (generally with an area of at least 4km²) provides a general indication of where the ACH is located. If you are a landowner and wish to find out more about the exact location of the place, please contact the Department of Planning, Lands and Heritage.
- **Culturally Sensitive = No:** Availability of information that the Department of Planning, Lands and Heritage holds in relation to the ACH is not restricted in any way.
- **Culturally Sensitive = Yes:** Some of the information that the Department of Planning, Lands and Heritage holds in relation to the ACH is restricted if it is considered culturally sensitive information. This information will only be made available if the Department of Planning, Lands and Heritage receives written approval from the people who provided the information. To request access please contact via https://achknowledge.dplh.wa.gov.au/ach-enquiry-form.
- **Culturally Sensitive Nature:**
  - **No Gender / Initiation Restrictions:** *Anyone* can view the information.
  - **Men only:** Only *males* can view restricted information.
  - **Women only:** Only *females* can view restricted information.

Status:

- **Register:** Aboriginal cultural heritage places that are assessed as meeting Section 5 of the *Aboriginal Heritage Act 1972*.
- **Lodged:** Information which has been received in relation to an Aboriginal cultural heritage place, but is yet to be assessed under Section 5 of the *Aboriginal Heritage Act 1972.*
- **Historic:** Aboriginal heritage places assessed as not meeting the criteria of Section 5 of the *Aboriginal Heritage Act 1972*. Includes places that no longer exist as a result of land use activities with existing approvals.

Place Type: The type of Aboriginal cultural heritage place. For example an artefact scatter place or engravings place.
Legacy ID: This is the former unique number that the former Department of Aboriginal Sites assigned to the place.

Disclaimer

Aboriginal heritage holds significant value to Aboriginal people for their social, spiritual, historical, scientific, or aesthetic importance within Aboriginal traditions, and provides an essential link for Aboriginal people to their past, present and future. In Western Australia Aboriginal heritage is protected under the *Aboriginal Heritage Act 1972*.

All Aboriginal cultural heritage in Western Australia is protected, whether or not the ACH has been reported or exists on the Register.

The information provided is made available in good faith and is predominately based on the information provided to the Department of Planning, Lands and Heritage by third parties. The information is provided solely on the basis that readers will be responsible for making their own assessment as to the accuracy of the information. If you find any errors or omissions in our records, including our maps, it would be appreciated if you provide the details to the Department via https://achknowledge.dplh.wa.gov.au/ach-enquiry-form and we will make every effort to rectify it as soon as possible.

DBCA Flora Database Searches

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date
514217	3219	Acacia anomala	T	Flowers yellow.	In laterite.			Common name `Chittering Grass Wattle'.	10/09/1985
2239671	3219	Acacia anomala	T	Rhizomatous shrub to 0.5 m.	Gravelly loam, steep slope.	Eucalyptus marginata - E. calophylla woodland.			11/09/1991
804967	3219	Acacia anomala	T	Slender form full flower and a grasslike shrub to 40 cms.	Steep slope SSE aspect near crest. Loam over gravel.	In Eucalyptus marginata 10 m, Euc. calophylla -12 m woodland with scattered Casuarina fraserana to 50 m, Xanthorrhea preissii -3 m, over Low Scrub of Hakea undulata, Hakes amplexicaulis and Dense Low Heath.			2/09/1982
737089	3219	Acacia anomala	T	Slender form, full flower, grasslike shrub to 40 cm.	Steep slope, SSE aspect, crest of N side of gully. Brown sandy loam.	Growing in E. marginata, E. calophylla, Casuarina fraserana over low shrub over dense low heath.			2/09/1982
9669183	3220	Acacia aphylla	T	Shrub to 2 m.	S facing slope. Soil: brown sandy loam with gravel.	Jarrah/marri forest with shrub understorey.	2 plants.		17/11/2023
920894	3220	Acacia aphylla	T						/06/1974
116351	3220	Acacia aphylla	T	Sturdy shrub to 1.5 m, flowers yellow, single, globular leafless, dichotomously branched.	Granite.				5/08/1970
5880491	3220	Acacia aphylla	T		Slope. Moist - dry, brown clay loam. Granite - boulder.	Muir's: scattered marri on road verge. Hakea incrassata, H. erinacea, H. petiolaris, Dryandra armata, D. lindleyana, Nemcia sp., Xanthorrhoea preissii.	6 mature plants, 8 seedlings.		11/07/2001
1189018	3220	Acacia aphylla	T		Growing on road verge.				30/12/1987
9784055	3220	Acacia aphylla	T	Erect shrub 1.7 m high with yellow flowers. Flower in bud and early flowering stage.	On north and south verges.	Eucalyptus marginata and Corymbia calophylla open woodland 10-30 m, 0.25-20% on south side, grading to granite heathland to the north.	4 plants.		7/07/2020
9784233	3220	Acacia aphylla	T	Erect shrub 1.7 m high with yellow flowers. Flower in bud and early flowering stage.	On north and south verges.	Eucalyptus marginata and Corymbia calophylla open woodland 10-30 m, 0.25-20% on south side, grading to granite heathland to the north.	4 plants.		7/07/2020
8273553	3237	Acacia benthamii	2	Slender erect open shrub 70 cm high x 50 cm wide. In bud.	Slope above creek. Grey sand.	Degraded Tuart open woodland over Banksia low woodland.	scattered shrubs.		8/07/2007

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date
7485263	11229	Acacia drummondii subsp. affinis	3	Erect, perennial shrub up to 1 m high. Flowers yellow.	Hillside. Clay, rocky. In disturbed soil on road verge.	Medium trees, Marri.	21-50 plants.	Adult population. Percentage of plants flowering 90%.	25/06/2006
126209	3373	Acacia horridula	3	Flowers pale lemon. Height 1 - 2 ft.	Gravel.				5/06/1977
607509	14129	Acacia oncinophylla subsp. oncinophylla	3	Flowers yellow.					/09/1919
607592	14129	Acacia oncinophylla subsp. oncinophylla	3						30/09/1901
607614	14129	Acacia oncinophylla subsp. oncinophylla	3						/09/1916
607495	14129	Acacia oncinophylla subsp. oncinophylla	3	Shrub 4 - 6 ft.					/10/1939
607576	14129	Acacia oncinophylla subsp. oncinophylla	3						/01/1979
607541	14129	Acacia oncinophylla subsp. oncinophylla	3	Shrub to 1 m with many more or less erect branches; flowers yellow.	Near granite.				8/09/1961
5082846	14129	Acacia oncinophylla subsp. oncinophylla	3		Grey-brown gritty loam, with lateritic gravel and cobbels on surface, on a gentle-steep midslope.	Grevillea endilcheriana Low Scrub, over Trymalium lidifolium, Baeckea camphorosmae Dwarf Scrub, over Borya sphaerocephala Dense Herbs.			18/09/1996
7373856	14129	Acacia oncinophylla subsp. oncinophylla	3	Prostrate.	Numerous outcrops. Lower slope. Granite. Sandy loam with quartz.	Open heath.	2 plants.	Healthy population low disturbance.	4/10/2005
6921965	14129	Acacia oncinophylla subsp. oncinophylla	3	Shrub.	S facing slope. Brown loam and granite. Burnt 1989.	Open woodland of Marri and Wandoo over heath to 1 m. Darwinia pimelioides, Daviesia horrida, Trymalium ledifolium, Hakea cristata, Diplolaena sp., Phyllantus calycinus. Area weedy.			17/08/1992
607584	14129	Acacia oncinophylla subsp. oncinophylla	3	3 ft high. Flowers yellow.	Granite.	Heath.	scarce.		26/09/1977
607649	14131	Acacia oncinophylla subsp. patulifolia	4						/08/1971
4570502	14131	Acacia oncinophylla subsp. patulifolia	4	Shrub 2-3 ft (0.6-0.9 m).	Open position, heavy soil, base of Darling Scarp.				21/09/1946

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date
5097444	14131	Acacia oncinophylla subsp. patulifolia	4		Dark brown gritty loam, with surface gravel and cobbels on a very steep southern upper slope.	Grevillea endlicheriana, Hakea undulata Open Low Scrub, over Trymalium ledifolium, Hakea undulata mixed Dense Low Heath, over Amphipogon turbinata Low Grass, over Gonocarpus cordiger Very Open Herbs.			24/09/1996
8256136	18195	Amanita carneiphylla	3	Pileus up to 165 mm diameter, white, hemispheric when young applanate when mature, non-strate appendiculate margin, slightly viscid, no odour, context white, unchanging. Universal veil on the pileus: white, adnate, initially covering the whole pileus the	On Karrakatta sand. Emerging from deep sand.	Degraded Banksias woodland. Species of plants nearby: Jacksonia furcellata.	3 collected.	Microscopic character details housed with specimen. Gill piece taken for sequencing 27.1.13. - E. Davison.	15/06/2002
2224283	46334	Amanita kalamundae	3		In deep litter.	Under Eucalyptus patens and Agonis eriafolia.		MU89/110. Sporeprint.	18/06/1989
8774773	48332	Amanita preissii	3	Pileus to 48, 60 mm diameter, 4, 5 mm thick, white, plane with slightly depressed centre, margin appendiculate, context white, yellowing beneath pellis. Universal veil on pileus of thin layer over whole disc, breaking into small warts in centre of disc,		Garden of WA plants. Nearby woody plants: Eucalyptus spp., Calitris sp., Actinostrobus sp, Hemiandra sp.	single specimen.	Sequences for GenBank: ITS, nuLSU, BTUB, EF, RPB2.	22/05/2005
9327231	6309	Andersonia gracilis	T	Scraggly shrub with blue-green leaves and pink flowers.	Plain, brown sandy clay loam.	Tall open shrubland of Callitris pyramidalis over mid sparse shrubland of Beaufortia squarrosa and Petrophile seminuda over low sparse shrubland of Hypocalymma angustifolium subsp. Swan Coastal Plain (G.J. Keighery 16777). Some minor weeds present.	c. 15 plants seen at this location.		22/10/2019

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date
7129238	6946	Anthocercis gracilis	T		Slope - outcrop. Moist brown loam-clay, granite boulder. Burnt by wildfire in Summer 1996/97 and Summer 2003/04.	Marri and Wandoo open woodland. Macrozamia riedlii, Xanthorrhoea preissii, Hakea cristata, Acacia pulchella, Pimelea ciliata, Trymalium ledifolium, Rulingia cygnorum, Hibbertia hypericoides, Dryandra lindleyana, Darwinia citriodora, Caladenia sp., Diuris	1500+ mature plants.	Substantial weed invasion following a wildfire in the summer of 2003.	21/07/2005
9590692	6946	Anthocercis gracilis	T	Slender, sprawling shrub to 1.5 m tall. When flowering, petals pale yellow with a purple stripe down middle, purple at base.	SE facing slope. Uphill from creekline. Soil: Dark brown sandy loam.	Eucalyptus woodland with mid-dense shrubs to 1.5 m, with Banksia (Dryandra) sp., Macrozamia sp., Pimelea sp., Acacia sp., Xanthorrhoea preissii, Orthrosanthus laxus, Hakea lissocarpha, Eucalyptus wandoo, Corymbia calophylla, Trymalium [odoratissimum].	>100 plants.		16/12/2022
1059238	6946	Anthocercis gracilis	T			Growing in understorey.			15/08/1984
1059211	6946	Anthocercis gracilis	T	Straggling herb to 60 cm tall.					19/05/1984
5208963	6946	Anthocercis gracilis	T		Red-brown clayey loam, with dolerite cobbels and boulders, on a very steep south-eastern lower slope.	Eucalyptus laeliae, E. calophylla, E. wandoo Low Woodland, over Trymalium floribundum, Xanthorrhoea preissii Dense Heath, over Macrozamia reidlii, Phyllanthus calycinus Low Heath, over Loxocarya flexuosa Tall Sedges.			8/10/1996
5462096	6946	Anthocercis gracilis	T		Aspect S. Slope/outcrop/drainage line. Moist/dry red/brown/yellow loam/clay. Granite sheet/boulder. At times plants can be seen beside the walk trail W and growing to within 10 m of the water.	(Muir's) Regrowth marri and wandoo open woodland. Associated species: Acacia pulchella, Pimelea ciliata, Darwinia citriodora, Grevillea manglesii sp., G. bipinnatifida, Zamia, Hovea pungens, Daviesia horrida, Hakea cristata, Calothamnus sp.		Condition of population: healthy/moderate/ poor.	21/10/1999
7185308	6946	Anthocercis gracilis	T		Outcrop, slope, gully with granite sheet and boulders, granitic sand and dry brown loam. Burnt in summer of 2004/2005.	Scattered marri with Hakea crystata, Xanthorrhoea preissi, Acacia pulchella, Diplopeltis huegelii, Grevillea manglesii, Goodenia fasciculata and Hibbertia hypericoides. Massive infestation of Watsonia weeds.	30 mature plants over 10 m NS x 5 m EW.		29/08/2005

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date
9689222	6946	Anthocercis gracilis	T	Slender, multi-branched, low spreading shrub to 45 cm high, 80 cm wide. Cream-green and purple, pendulous flowers.	South facing gentle slope leading to Jane Brook with small granite outcrops.	Open Eucalyptus wandoo and Eucalyptus marginata woodland over Trymalium odoratissimum, Xanthorrhoea preissii, Hibbertia hypericoides shrubland.		Last burnt in October 2018 prescribed burn (ca. 4.5 YSLF).	7/07/2023
8738378	6946	Anthocercis gracilis	T	Slender, inconspicuous, intricately branched shrub. Fairly short-lived, growing and flourishing after fire. Flowers delicate hanging yellow bells.	Granitic loam, among granite boulders.	Under Rock Sheoak, with Balga, Warrine, Zamia and Forest Rice-grass.		Flowers in spring. Fire response - seeder.	23/09/1995
493376	7849	Asteridea gracilis	3		Rocky.				26/09/1977
9487999	50979	Austrostipa bronweniae	T	Clumped perennial grass to 0.8 m.	Seasonally inundated dampland, flat with sandy clay soil.	Very Open to Closed Tall Heath of Viminaria juncea, Melaleuca acutifolia, M. osullivanii, M. viminea, Callitris pyramidalis, Banksia telmatiaea, Grevillea thelemanniana subsp. thelemanniana, Hypocalymma angustifolium, Acacia lasiocarpa over Very Open to	278 mature and 1 juvenile.	Some plants occur on a walk track. Plants were in poor to moderate condition, looking very brown and dry (natural over-summer senescence?). The population is within a known Muchea Limestone TEC.	9/01/2015

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date
8133077	50979	Austrostipa bronweniae	T	Perennial grass, 0.6 m high x 0.3 m wide. Flowers green. Reproductive method: seeds, caespitose.	Wetland. Seasonally waterlogged muddy sand. Burnt ca 3 years ago.	Low trees. With Gahnia trifida, Actinostrobus pyramidalis, Grevillea thelemanniana, Melaleuca viminea subsp. viminea.		Aliens <5% cover. Other alien species: few (1-3). Population structure: immature seedlings and mature plants, 100% flowering. Two other small populations next door at Lot 28 Brook Road.	18/09/2009
8133069	50979	Austrostipa bronweniae	T	Perennial grass, 0.6 m high x 0.3 m wide. Flowers green. Reproductive method: seeds, caespitose.	Wetland. Seasonally waterlogged muddy sand. Burnt ca 3 years ago.	Low trees. With Gahnia trifida, Actinostrobus pyramidalis, Grevillea thelemanniana, Melaleuca viminea subsp. viminea.		Aliens <5% cover. Other alien species: few (1-3). Population structure: immature seedlings and mature plants, 100% flowering. Two other small populations next door at Lot 28 Brook Road.	18/09/2009
8816484	50979	Austrostipa bronweniae	T	Clumping, perennial grass. 0.6 m (in spike to 1.1.m) x to 0.5 m wide.	Dampland. Dry at time of collection. Seasonally wet. Brown to grey sandy clay.	Callitris pyramidalis and Viminaria juncea Tall Open Shrubland over Hypocalymma angustifolium, Grevillea thelemanniana var. thelemanniana, Acacia lasiocarpa, Boronia crenulata, Open Low Heath and Sedgeland/Herbland dominated by Chaetanthus aristatus, Cen	188 mature clumps and 45 juveniles.	Some clumps were in dense heath on the dampland and others were in relatively open sections.	29/10/2013
2474123	32211	Banksia mimica	T	Prostrate dwarf shrub to 15 cm.	In grey sand on slight rise next to flat.	Recently burnt. In heath with emergent Kingia australis, Nuytsia floribunda, Adenanthos cygnorum, Banksia menziesii, Dryandra nivea.		Abundance: occasional	21/03/1990
2474115	32211	Banksia mimica	T	Prostrate dwarf shrub to 25 cm high.	White sand on flat ground.	In very open woodland with heath understory. Banksia attenuata, B. menziesii, Adenanthos cygnorum, Nuytsia floribunda, Casuarina fraseriana, Xanthorrhoea.		Abundance: 20 plants.	4/04/1990

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date
9327169	32211	Banksia mimica	T	Prostrate, spreading lignotuberous shrub to 25 cm with yellow flowers.	Flat, grey sand.	Mid sparse shrubland of Allocasuarina humilis and Lambertia multiflora var. darlingensis over low sparse shrubland of Eremaea pauciflora var. pauciflora over mid sparse sedgeland of Cyathochaeta equitans.	4 plants at this location.		18/12/2019
9704744	32211	Banksia mimica	T	Rhizomatous, clumping shrub to 0.40 m high. Upright entire, toothed leaves up to 8 mm wide and yellow/brown flowers at ground level.	Flat palusplain, grey sand.	Occasional Eucalyptus patens and Nuytsia floribunda over Tall Shrubland of Adenanthos cygnorum over Shrubland of Xanthorrhoea preissii, Kingia australis, Eremaea pauciflora, Jacksonia floribunda, Banksia nivea, Bossiaea eriocarpa, Stirlingia latifolia, P	5 plants.	Plant 1. Flower collection taken from Population 15A. Partial survey.	23/01/2024
9704736	32211	Banksia mimica	T	Rhizomatous, clumping shrub to 0.40 m high. Upright entire, toothed leaves up to 8 mm wide and yellow/brown flowers at ground level.	Flat palusplain, grey sand.	Occasional Eucalyptus patens and Nuytsia floribunda over Tall Shrubland of Adenanthos cygnorum over Shrubland of Xanthorrhoea preissii, Kingia australis, Eremaea pauciflora, Jacksonia floribunda, Banksia nivea, Bossiaea eriocarpa, Stirlingia latifolia, P	5 plants.	Plant 2. Flower collection taken from Population 15A. Partial survey.	23/01/2024
4634861	32138	Banksia pteridifolia subsp. vernalis	3						26/09/1989
3358666	32138	Banksia pteridifolia subsp. vernalis	3	Prostrate shrub 40 cm tall x 50 cm wide. New growth pink/brown. No buds, flowers or fruits.	Flat, sandy soils over loamy sands 0.4 m deep.		one group of 5 plants near Casuarina Road.		27/10/1992
3358674	32138	Banksia pteridifolia subsp. vernalis	3	Prostrate shrub to 0.4 m tall by 0.8 m wide.	Flat, grey sand.	Jarrah/Banksia over mixed heath natives.			14/01/1993
6166857	32138	Banksia pteridifolia subsp. vernalis	3		Flat. Dry grey sand. Previously a bridle trail.	Banksia attenuata - Eucalyptus marginata woodland. Lambertia multiflora subsp. darlingensis, Isopogon drummondii, Conospermum undulatum, Hakea ruscifolia, Hypolaena exsulca.	ca 10 plants.		8/08/1998
6038328	32138	Banksia pteridifolia subsp. vernalis	3	Stems underground, resprouting after fire; leaves somewhat glaucous when young; perianth and style pale gold.	On sandy flat.	With low shrubs and occasional Casuarina fraseriana and Eucalyptus marginata.			18/08/1998

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date

8436975	13653	Calytrix breviseta subsp. breviseta	T	Spreading low shrub 0.2-0.4 m high x 0.2-0.6 m wide. Purple-blue flowers. Small angular leaves to 6 mm. Twiggy shrubs.	Edge of seasonal clay base open depression. Moist, grey-brown sand to fine sandy loam over clay.	Tall Open shrubland of Callitris pyramidalus, Viminaria juncea and Melaleuca acutifolia over Open Heath of Hypocalymma angustifolia and Acacia lasiocarpa over Open Sedgeland of Schoenus rigens, Chaetanthus aristatus over Herbland of Centrolepis aristata,	4 plants.		13/09/2012
2074516	759	Carex tereticaulis	3						/10/1903
5392977	759	Carex tereticaulis	3	Grass like herb 1 m high x 0.1 m wide.	Watercourse, wet. Organic litter. Grey Bassendean Sand over sand.	Dense Forest. Eucalyptus rudis, Melaleuca rhaphiophylla.	occasional.		17/05/1999

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date
9553371	51734	Commersonia sp. Lesmurdie (A.A. Mitchell 11429)	2	Semi scrambling shrub with white flowers growing up to 1.3 m tall.	Sloping seepage with brown cracking clay soil on basalt sill.	Melaleuca woodland with an understorey of 3 m tall tussocking sedges.	infrequent.		13/11/2022
9553339	51734	Commersonia sp. Lesmurdie (A.A. Mitchell 11429)	2	Erect shrub to 1.5 m tall. Flowers whitish/cream calyx and petals. Early fruiting.	On a hillside of brown cracking clay soil on a basalt sill/dyke.	Occurs in tall Melaleuca woodland with 3 m tall tussocking sedges and Lasiopetalum bracteatum.			/12/2023
2159597	13999	Conospermum undulatum	T	Shrub to 2 m. Leaf margins undulate. Inflorescences emergent above branches.	Low rise, grey sand.	In Banksia open low woodland A over Low scrub A and Low heath D.			24/10/1990
2159627	13999	Conospermum undulatum	T		Clayey sand over gravel.	Open woodland of Eucalyptus marginata, E. calophylla over open low scrub A of Hakea sp., over dense low heath c.		Abundance: 500 + plants.	/09/1990
2159570	13999	Conospermum undulatum	T	Erect shrub. Several plants with less undulate leaves intermixed with norma; undulate type.	Grey sand over yellow sand.	Dense low heat C of Pericalymma ellipticum.			12/11/1990
1409395	13999	Conospermum undulatum	T	Small compact shrub to 1.5 m.					20/10/1977
3136973	13999	Conospermum undulatum	T	1.00 m height.	Grey sandy soils, bottom of Darling Scarp.	0.5 -1.0 m open heathland not burnt. Banksia sp.		Abundance: frequent.	25/08/1993
1409379	13999	Conospermum undulatum	T						/06/1901
2159619	13999	Conospermum undulatum	T		Yellow-orange clayey sand over gravel.	With Banksia menziesii, B. attenuata, Eucalyptus marginata, Isopogon drummondii, Hakea conchifolia.		Abundance: 50 + plant in flower.	6/10/1990
2159783	13999	Conospermum undulatum	T		Yellow sand over laterite.	With Allocasuarina fraserina, A. humilis, Eucalyptus marginata, Banksia grandis, B. menziesii, Lambertia multiflora, Hakea conchifolia, Isopogon drummondii, B. incana.		Abundance: 50 plants	6/10/1990
1409387	13999	Conospermum undulatum	T	Multistemmed shrub, 4 ft tall.	On gravel at base of scarp.				/08/1971
2159732	13999	Conospermum undulatum	T		Yellow-grey sand, flat.	Banksia attenuata - B. menziesii Low Woodland A over open Low Scrub B.		Abundance: 400 + plants	14/10/1990
4612698	13999	Conospermum undulatum	T						20/10/1992

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date
2160013	13999	Conospermum undulatum	T	Narrow, erect shrub. Leaves distinctly undulate. Inflorescences emergent above branches.	Grey-white sand over laterite. Flat to gradual slope.	Banksia attenuata, B. menziesii Low Woodland over dwarf scrub and low heath.		Abundance: c. 1000-1500 plants	19/10/1990
5314054	13999	Conospermum undulatum	T	Sprawling shrub 1 m tall.	Low plain/swamp. White-grey sand. Bassendean-Southern River complex. Seasonal dampland. Probably burnt within last 5 years.	Heath B/Open low sedges/Open herbs with Melaleuca preissiana, Stirlingia latifolia, Anigozanthos manglesii, A. viridis, Mesomelaena tetragona, Dasypogon bromeliifolius.	1 plant.		21/01/1999
2159589	13999	Conospermum undulatum	T		Yellow sand over laterite.	Open low woodland of Allocasuaring fraserina and Eucalyptus marginata over dense low heath C of Lambertia multiflora with some Banksia incana.		Abundance: 800 + plants	6/10/1990
2159643	13999	Conospermum undulatum	T		Grey sand over yellow sand.	Open low woodland of Allocasuarina fraseriana, Banksia attenuata over heath B over low heath C. Lambertia multiflora, Hakea conchifolia, Adenanthos cygnorum, Isopogon drummondii.		Abundance: 50 + flowering plants	14/10/1990
2159694	13999	Conospermum undulatum	T		White-grey sand over yellow sand.	Low woodland A over dense low heath C. With Banksia menziesii, B. attenuata, Eucalyptus todtiana, Lambertia multiflora, Isopogon drummondii, Eremaea paucilfora.		Abundance: 500 + plants in flower.	6/10/1990
2159651	13999	Conospermum undulatum	T		Yellow clayey sand over gravel.	Surrounded by dense low heath.		Abundance: 50 + plants	14/10/1990
2159724	13999	Conospermum undulatum	T		Sand and gravel, flat.	In Banksia - Eucalyptus low forest B over open low scrub A over dense low heath C. Lambertia multiflora and Isopogon drummondii.		Abundance: 100 + plants	7/10/1990
2159791	13999	Conospermum undulatum	T	Shrub to 0.75 m, leaves undulate. Inflorescences erect above braches. Full flower.	Grey sand, flat.	Regenerating Eucalyptus marginata, Banksia menziesii, B. attenuata woodland over heath B.		Abundance: 50-60 plants	7/11/1990
2159678	13999	Conospermum undulatum	T		Grey sand.	In low forest A over low heath C. Associated species, Banksia menziesiim Eucalyptus marginata, Allocasuarina fraseriana, Lambertia multiflora, Isopogon drummondii.		Abundance: 15 flowering plants.	7/10/1990
2159600	13999	Conospermum undulatum	T		Flat, sand with gravel.	Low forest A of Banksia attenuata, B. menziesii and Allocasuarina fraseriana. In association with Lambertia multiflora and Isopogon drummondii.			12/11/1990

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date
2159635	13999	Conospermum undulatum	T		Flat land on orange-yellow clayey sand over laterite.	In open low woodland of Eucalyptus marginata, E. calophylla over dense low heath.		Abundance: 2000 + plants.	/09/1990
1814214	13999	Conospermum undulatum	T	Erect woody shrub, to 1.5 m. Flowers white-grey, in full flower.	Deep yellow sand.	Low open Banksia woodland.			15/09/1984
2160005	13999	Conospermum undulatum	T	Erect shrub, leaves with undulate margins. Inflorescences emergent above branches.	Brown-grey sand, flat to gentle slope.	Banksia attenauta, B. menziesii low forest over low heath.			12/11/1990
1409298	13999	Conospermum undulatum	T	"Smoke Bush".				"Smoke Bush".	11/10/1918
2161478	13999	Conospermum undulatum	T	Low shrub to 0.6 m. Leaves onl slightly undulate.	Low lying flat, brown sand.	Regenerating Pericalymma ellipticum Dense Heath A.		Abundance: 2 plants	7/11/1990
1409344	13999	Conospermum undulatum	T		On sand.	Jarrah-sheoak association.			22/08/1961
5057493	13999	Conospermum undulatum	T		Red gravelly clay, with lateritic gravel, on a gentle northern lower slope.	Eucalyptus marginata, E. calophylla Open Low Woodland, over Hakea lissocarpha, Acacia pulchella, Xanthorrhoea preissii Dense Low Heath, over Conostylis setigera, Mesomelaena tetragona Open Tall Sedges.			20/09/1996
5299535	13999	Conospermum undulatum	T		NNW aspect. Slope. Dry yellow/grey sand.	(Muir's) Jarrah, marri and Allocasuarina fraseriana woodland. Hakea trifurcata, H. conchifolia, H. ruscifolia, H. lissocarpha, H. stenocarpa, Isopogon dubius, I. drummondii, Xanthorrhoea preissii, X. gracilis, Lambertia multiflorus, Hibbertia hypericoide			23/09/1998
5299527	13999	Conospermum undulatum	T		N-W aspect. Slope. Dry brown/yellow/grey sand/loam/clay/gravel.	(Muir's) Jarrah, Marri open woodland. Xanthorrhoea preissii, X. gracilis, Acacia pulchella, Dryandra lindleyana, Hakea ruscifolia, H. undulata, H. lissocarpha, Zamia, Hibbertia hypericoides, Daviesia decurrens, Leschenaultia biloba, Sedge sp., Hypocalymm			23/09/1998

4072324	13999	Conospermum undulatum	T	Shrub to 1.5 m, seed.	Light grey sandy soil, slight rise.	Banksia woodland, closed understory, not burnt.		Locally common.	14/12/1994

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date
6936768	13999	Conospermum undulatum	T	Perennial, spreading, open shrub, 1 m x 1 m, with white flowers.	Gentle slope at foot of Darling Scarp in reserve which was once a gravel pit, on lateritic gravel. Burnt March 2004.	Regrowth open Jarrah-Marri woodland with Hakea trifurcata, Xanthorrhoea preissii, Calothamnus sanguineus, Hibbertia hypericoides and fringing Dryandra sessilis thicket.	several plants in one area only.	Leaves only collected. Older plants are just beyond the limit of the fire but there seem to be regrowths in burnt area.	31/10/2004
2159759	13999	Conospermum undulatum	T		Grey sand over yellow sand.	Low woodland A of Eucalyptus marginata, Allocasuarina fraserina, Banksia menziesii, over open low scrub of Lambertia multiflora with Isopogon drummondii over dense low heath C		Abundance: 100 + plants in flower.	14/10/1990
2159686	13999	Conospermum undulatum	T		Grey sand over yellow sand.	Low woodland A (Banksia menziesii, Eucalyptus marginata, Allo- casuarina fraseriana over dense low heath.	300+ plants in flower.		14/10/1990
1409360	13999	Conospermum undulatum	T	Shrub 1 - 1.5 m high with grey flowers.	Sandy soil. Melaleauca flats often swampy.	Restionaceae, Cyperaceae, Acacia, Hakea, etc occurring.			6/09/1976
1409336	13999	Conospermum undulatum	T	Erect shrub 1 m. Flowers grey.					5/10/1978
1409328	13999	Conospermum undulatum	T	Shrub 1 - 1.5 m high with greyish flowers.	White sandy soils.	Among tall Banksias, with Gompholobium, Hibbertia, Acacia, etc.			6/09/1976
2159740	13999	Conospermum undulatum	T		Yellow clayey sand over gravel.	Low Woodland A of Eucalyptus marginata and E. calophylla over heath B of Lambertia multiflora over low heath C.		Abundance: Less than 10 flowering plants.	14/10/1990
2161451	13999	Conospermum undulatum	T		Grey sand over laterite, flat.	Open low woodland A of Eucalyptus marginata, E. calophylla, Banksia menziesii and B. attenuata over dense heath B.		Abundance: 100-150 plants.	23/04/1990
4219309	13999	Conospermum undulatum	T	Erect shrub to 1.5 m.	Grey sand.	Open woodland, Eucalyptus marginata, Banksia attenuata, Banksia menziesii, Stirlingia latifolia, Hibbertia hypericoides.		Abundance: c. 50 plants	8/11/1994
4221419	13999	Conospermum undulatum	T	Shrub to 1.5 m. Flowers smokey-white, in full flower.	Yellow sand, colluvial.	Banksia menziesii/attenuata low forest.	scattered in area.		20/08/1991
5132525	13999	Conospermum undulatum	T	Woody, open, few stemmed shrub to 1m high, perianth segments black, leaves basal.	On small unfenced suburban block. Grey sandy soil.	With Eucalyptus marginata and shrub understorey including Casuarina, Lambertia, Dasypogon, Hibbertia spp.			3/10/1996

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date
6797083	13999	Conospermum undulatum	T		Small rise at base of Darling Scarp. Dry, yellow-grey sand.	Woodland over shrubland. Associated species: Alexgeorgea nitens, Daviesia nudiflora, Dryandra lindleyana, Pityrodia bartlingii, Hakea ruscifolia, Hibbertia hypericoides, Jarrah, Marri, Bossiaea eriocarpa.	177 mature plants in area 165 x 30 m.	Condition of population: healthy.	9/03/2005
7892853	13999	Conospermum undulatum	T	Straggling, multi-stemmed shrub to 1.4 m; leaves crowded at ends of bare branches. Inflorescences and flowers white-woolly, the perianth black inside.	Sandplain - Bassendean Sand.	Jarrah-Marri-Banksia attenuata-Adenanthos cygnorum heathy woodland.	frequent but localised.		11/08/2007
7274459	13999	Conospermum undulatum	T	Multi-stemmed erect shrub 1-1.5 m high. Flowers silvery-white; in flower.	Edges of and shallow sandy rises. Grey sand over clay.	Disturbed ? Banksia low woodland.	only 2-5 plants in area.		15/10/2005
6234747	13999	Conospermum undulatum	T	Erect shrub.	Plain. Grey sand.		scattered with a range of maturity. 37 plants including 4 very small ones.	Plants in very healthy habitat.	7/10/2003
6234755	13999	Conospermum undulatum	T	Erect shrub. Plants flowering but many have lost buds.	Watercourse. Grey sand.		locally common.		7/10/2003
6723624	13999	Conospermum undulatum	T		Sandy soil. Not burnt.	Banksia woodland.			//
6723632	13999	Conospermum undulatum	T			Burnt and regenerating.			//
6723705	13999	Conospermum undulatum	T			Regrowth.			//
6723713	13999	Conospermum undulatum	T						//
6112919	13999	Conospermum undulatum	T	Shrub to 1.5 m tall. Undulate leaves.	Flat. White sand.	Banksia woodland. Associated species: Allocasuarina huegeliana, A. fraseri, Banksia attenuata, Hibbertia sp., Daviesia sp., Adenanthos sp., Lambertia multiflora var. darlingensis.	100+.		1/11/2001

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date
5586712	13999	Conospermum undulatum	T		Low lying plain, swamp-like in winter. Moist white-grey sand-clay over laterite. Plants begin ca 500 m N of Tonkin Highway intersection along road verge and into private property behind verge into bush.	Associated vegetation: Eucalyptus todtiana, Melaleuca, Allocasuarina, Banksia.		Condition of population: moderate.	14/01/1999
5815762	13999	Conospermum undulatum	T		Flat. Dry grey sand.	Associated species: Banksia sp., Allocasuarina humilis, sedges, Daviesia sp., Dryandra lindleyana, Xanthorrhoea preissii.		Condition of population: healthy.	9/04/2001
6511473	13999	Conospermum undulatum	T	Flowers white.	Dune Ridge; flat ground. Brown sand over yellow sand, well drained.	Associated species: Banksia menziesii.			10/11/1995
6950906	13999	Conospermum undulatum	T		Gently sloping dune with grey over yellow sand.	Woodland over shrubland with Allocasuarina fraseriana, Banksia attenuata, Banksia menziesii, Xanthorrhoea preissii, Dryandra lindleyana, Lambertia multiflora var. darlingensis, Isopogon drummondii, Caustis dioica, Hakea prostrata and Daviesia nudiflora.	39 mature plants over ca 300 m x 50 m in area.	Central population in very good condition, remainder in degraded condition with weeds.	27/01/2005
7193920	13999	Conospermum undulatum	T		Sand over laterite.	With Stirlingia latifolia, Allocasuarina fraseriana, Corymbia calophylla, Dryandra sessilis, Grevillea wilsonii, Hakea stenocarpa, Petrophile striata, Hibbertia hypericoides, Hypocalymma robustum, Philotheca spicata, Haemodorum paniculatum, Conostylis ca			9/09/2005
7373821	13999	Conospermum undulatum	T		Sand dune. Grey sand.	Open Banksia woodland with Eucalyptus marginata, Corymbia calophylla, Banksia attenuata, B. menziesii, B. grandis, Stirlingia latifolia.			26/11/2002
2159996	13999	Conospermum undulatum	T	Erect, narrow shrub 1.2 m high.	Grey sand over laterite on flat terrain.	Woodland and heath with Banksia attenuata, B. menziesii, Allo- casuarina fraseriana, Isopogon drummondii.	frequent-occasional.		23/04/1990

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date
8134162	13999	Conospermum undulatum	T	Perennial shrub, 0.80 m high x 0.20 m wide. Flowers white.	Plain. Dry grey soil. Old soil disturbance.	Medium trees. With Banksia menziesii, Allocasuarina fraseriana, Xanthorrhoea preissii, Conostylis aculeata, Anigozanthos manglesii, Adenanthos cygnorum.	6-20 plants, 10 mature plants.	Population structure: adult, 100% in bud, 50% flowering. Other alien species: many (4 or more). Total weed cover: up to 25% of site.	24/07/2009
8863830	13999	Conospermum undulatum	T	Erect compact shrub, 0.8 m high with old flowering scapes, leaves narrowly linear to 10 mm wide, tapering to base, distinctly undulating leaf margins.	In grey sand on flat, well-drained site. Frequent slashing between bushland remnants.	Woodland of Eucalyptus marginata over Low Closed Forest of Banksia menziesii, Allocasuarina fraseriana, Agonis flexuosa (naturalised from planting) over Shrubland of Adenanthos cygnorum, Lambertia multiflora, Daviesia divaricata over Low Shrubland of All	2 plants only.		7/12/2016
7684088	13999	Conospermum undulatum	T		Slope. Brown sand.	Low Woodland of mixed species including Bossiaea eriocarpa, Banksia menziesii, Eucalyptus marginata over Open Low Heath of mixed species dominated by Eremaea pauciflora, Allocasuarina humilis, Xanthorrhoea preissii and Lambertia multiflora var. darlingen		Healthy population.	22/09/2004
7888198	13999	Conospermum undulatum	T	Shrub.	Flat. Grey sand.	Low woodland (Disturbed). Banksia attenuata, Banksia menziesii, Banksia ilicifolia, Hibbertia subvaginata, Dasypogon bromeliifolius, Melaleuca seriata, Lyginia barbata, Patersonia occidentalis.			21/08/2002
7888201	13999	Conospermum undulatum	T	Shrub.	Flat. Grey sand.	Woodland. Corymbia calophylla, Banksia attenuata, Banksia menziesii, Melaleuca preissiana, Xanthorrhoea preissii, Hypocalymma angustifolium, Adenanthos obovatus, Regelia ciliata, Jacksonia furcellata.			3/09/2002
7746903	13999	Conospermum undulatum	T	Erect shrub with grey-white flowers 120 cm high. Flowers grey/white.	Grey sand. + 3 years since fire. Disturbed.	Acacia pulchella var. pulchella, Stirlingia latifolia, Desmocladus flexuosus, Corymbia citriodora, Persoonia saccata, Synaphea gracillima, Banksia menziesii, B. attenuata, Chamaecytisus palmensis, Eucalyptus todtiana, Melaleuca sericata and Jacksonia flo	2-5 plants.		21/08/2002

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date
8863849	13999	Conospermum undulatum	T	Low compact shrub, 0.5 m high, with old flowering scapes, leaves linear/narrowly elliptic to 20 mm wide tapering to base, undulating margins.	In grey sand on flat, well-drained site. Frequent slashing between bushland remnants.	Disturbed small remnants of Open Woodland of Eucalyptus marginata, Banksia menziesii, Allocasuarina fraseriana over Shrubland of Daviesia divaricata, Xanthorrhoea preissii, Eremaea pauciflora, Hibbertia hypericoides and Very Open Sedgeland of Mesomelaena	1 plant only.		7/12/2016
9006184	13999	Conospermum undulatum	T	Shrub, 1.5 m high x 0.7 m wide. Old flowers.	Flat, with dry grey/brown sandy loam.	Degraded site. Open Jarrah woodland with Banksia sessilis understorey. Associated species: Allocasuarina fraseriana and Grevillea wilsonii.	one plant only.	Not the usual habitat for this species.	15/05/2018
6714595	13999	Conospermum undulatum	T		Slope. Dry brown sand, laterite.	(Muir's) Jarrah and Marri open woodland. Isopogon sp., Grevillea trifurcata, Jacksonia sp., Anigozanthos manglesii, Conostylis sp., Leucopogon pulchellus.	3 plants over 15 m x 15 m.		2/10/2003
950548	50708	Cyanothamnus tenuis	4		Red stony soil.				22/08/1953
950025	50708	Cyanothamnus tenuis	4					Collected in August, no year given.	//
950521	50708	Cyanothamnus tenuis	4						21/08/1954
950513	50708	Cyanothamnus tenuis	4		Wooded hillside.				28/09/1955
1180460	50708	Cyanothamnus tenuis	4	Very spindly and open small shrub to 0.3 m. Flowers pink.	On edge of brook. Slope.	With Eucalyptus overstorey and many introduced weeds - Watsonia etc.		Abundance: occasional.	23/09/1990
5846080	16245	Cyathochaeta teretifolia	3	Clumped rhizomatous herb 1 m high, 10 cm wide.	Tumulus Spring, black peaty sand.	Closed sedgeland ((adjacent). With Melaleuca preissiana, Agonis linearifolia, Astartea aff. fascicularis.		Plants in cleared track, regrowth from rhizome unburnt plants to 1.8 m by 0.5 m; occasional plants flowering.	18/09/1999
4096711	16245	Cyathochaeta teretifolia	3						6/12/1902
1030507	16245	Cyathochaeta teretifolia	3		Swamp.	Habitat of Gahnia.			/12/1901

9517618	5505	Darwinia apiculata	T	Low spreading woody shrubs, c. 0.6 m x 2 m surface area from above. c. 25 cm tall. Leaves linear and apiculate. 3-6 fl. per infl., bracts orange-red-brown-green. Inflorescence sideways to pendulous.	Corymbia woodland, leaf litter over lateritic gravel. Flat undulating landscape.	Corymbia calophylla canopy, Xanthorrhoea procera, X. gracilis, Hibbertia, Banksia sessilis, Conostylis, Burchardia, Acacia, Drosera pallida.	20-40 plants.	Darwinia phylogenomics 2022 sample ID: Dapi_2.	8/09/2022
5962803	5505	Darwinia apiculata	T	Sprawling herb, 5 cm high by 50 cm wide. Flowering; immature fruit.	Gentle slope. Organic litter over brown/yellow clay. Underlying rock granite.	Forest over Open Low Woodland A with Dense Thicket. Characteristic species: Eucalyptus calophylla, E. marginata, Xanthorrhoea preissii and Darwinia citriodora.	common.		10/11/1999
5962811	5505	Darwinia apiculata	T	Sprawling herb, 5 cm high by 50 cm wide. Flowering; immature fruit.	Gentle slope. Organic litter over brown/yellow clay. Underlying rock granite.	Forest over Open Low Woodland A with Dense Thicket. Characteristic species: Eucalyptus calophylla, E. marginata, Xanthorrhoea preissii and Darwinia citriodora.	common.		10/11/1999
7439849	5505	Darwinia apiculata	T		Private land. Hilltop of moist concretionary gravel and laterite.	Open low woodland with associated vegetation: Marri - Jarrah, Dryandra sessilis, Dryandra sp., Conostylis sp, Hardenbergia comptoniana, numerous Orchiaceae spp.	160 mature plants 6 seedlings and 2 dead in area 0.28 acres.	Healthy population with a range of ages. General vegetation in excellent condition. Difficult in many areas to ascertain exactly how many plants are in the larger clumps.	25/07/2006
8439176	5505	Darwinia apiculata	T	Densely branched, low, spreading shrub. 20 cm high x 80 cm wide.	Flat with laterite and brown loam.	Open Eucalyptus woodland, Eucalyptus marginata and Corymbia calophylla over Allocasuarina fraseriana, Banksia sessilis, Xanthorrhoea preissii shrubland. Many weedy and introduced species including Briza maxima, Ursinia anthemoides, Chamaecytisus palmensi	2 plants in a small pocket of 425 sq m.	Isolated from more extensive bushland and a large population by gravel tracks.	10/11/2011

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date
8397198	5505	Darwinia apiculata	T	Small compact shrub to 40 cm tall.	SE facing slope around granite boulders. Brown-grey sandy loam.	Dense Low heath to 0.5 m. Corymbia calophylla, Darwinia citriodora, Hakea sp., Hibbertia sp., Hypocalymma sp., Trymalium sp.	>100 plants.		9/12/2011
6796451	5505	Darwinia apiculata	T		Uncleared area.				17/10/1982
1026704	5523	Darwinia pimelioides	4						30/08/1930
3200892	5523	Darwinia pimelioides	4		Brown loam with granite boulders.	Open woodland of Eucalyptus calophylla and E. wandoo with open heath to 1 m, with Xanthorrhoea sp., Daviesia horrida, Trymalium ledifolium, Diplolaena sp., Phyllanthus calycinus, Sowerbaea laxiflora, Hakea cristata.		Estimated 50+ mature, in bud and flower, burnt autumn 1989.	17/09/1992
9517634	5523	Darwinia pimelioides	4	Low shrubs, 20 cm high, spreading to upright. Ovate leaves, margins curled down. Downturned inflorescences in bud, bracts light green flushing pink at base and midrib. 4 flowers per infl.	Decomposed granite, W of granitic outcroppings. Partial to full shade.	Open Corymbia woodland. Hibbertia, Cassuarina, Lechenaultia, Banksia.	ca. 25 plants.	Darwinia phylogenomics 2022 sample ID: Dpim_1.	9/09/2022
1026720	5523	Darwinia pimelioides	4						/12/1925
1027190	5523	Darwinia pimelioides	4	Flowers and bracts small; low sub-shrub 8" - 10" tall.	Red loam.				1/10/1960

8816514	17150	Eremophila glabra subsp. chlorella	T	Shrub to 1 m high x ca 50 cm wide. Green-yellow flowers and small green round fruits in leaf axils.	In seasonally inundated Dampland in clay.	Melaleuca viminea and M. acutifolia Tall Open Scrub over Gahnia trifida and Juncus kraussii Very Open Sedgeland and weeds.	2 plants only.	Plants occur within a Conservation Category Wetland, BF site and TEC. Horses and land management have degraded majority of property.	24/10/2014
1277685	52779	Eryngium subdecumbens	3		Swamp.				18/12/1899
7316739	1984	Grevillea curviloba	T	Small upright shrub with curved leaflets, ripening warty fruit.	Dam at base of slope. Laterite, slope. Regrowth on excavated soil.	Eucalyptus marginata low woodland with mostly bare ground and regrowth of mixed shrub understorey.			25/11/2005

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date
5299551	50985	Grevillea dissectifolia	3		N aspect. Slope. Dry brown/yellow loam/clay.	(Muir's) Open marri woodland. Hakea trifurcata, H. undulata, H. erinacea, Acacia pulchella, Dryandra lindleyana, D. armata, Daviesia horrida, Petrophile biloba, Xanthorrhoea preissii, Grevillea pilulifera.			18/10/1998
5299578	50985	Grevillea dissectifolia	3		N aspect. Slope. Dry brown/yellow loam/clay.	(Muir's) Open marri woodland. Hakea trifurcata, H. undulata, H. erinacea, Acacia pulchella, Dryandra lindleyana, D. armata, Daviesia horrida, Petrophile biloba, Xanthorrhoea preissii, Grevillea pilulifera.			18/10/1998
6691625	50985	Grevillea dissectifolia	3		Landform: slope/outcrop. Rock type; granite. Rock form: boulder. Soil type: sand, loam and clay. Soil colour: brown/yellow. Soil condition: dry.	Vegetation classification: Scattered Marri. Associated species: Hakea trifurcata Hakea undulata, Hakea erinacea, Acacia pulchella, Dryandra armata, Dryandra lindleyana, Grevillea pilulifera, Xanthorrhoea preissii.	ca 3 mature plants.	Condition of population: healthy/moderate.	7/11/2003
1068687	13086	Grevillea pimeleoides	4						/08/1901
5208769	13086	Grevillea pimeleoides	4		Red-brown clayey loam, with dolerite cobbels and boulders, on a very steep south-eastern lower slope.	Eucalyptus laeliae, E. calophylla, E. wandoo Low Woodland, over Trymalium floribundum, Xanthorrhoea preissii Dense Heath, over Macrozamia reidlii, Phyllanthus calycinus Low Heath, over Loxocarya flexuosa Tall Sedges.			8/10/1996
9630198	2107	Grevillea thelemanniana	T	Spreading, shrub 2 m x 3 m to 0.5 m high.	Seasonal dampland, grey sandy clay.	Tall Shrubland of Melaleuca acutifolia over Open Heath of Hypocalymma angustifolium, Acacia lasiocarpa, Grevillea thelemanniana, Verticordia densiflora var. densiflora over Herbland of Centrolepis aristata, Burchardia bairdiae with Austrodanthonia setace	Approximately 165 plants in a 0.84 ha area.	Plants are mostly in two areas; within 15 m of and parallel to Boundary Rd and 15-65 m from Boundary Rd toward the centre of the block.	14/11/2014
9630112	2107	Grevillea thelemanniana	T	Spreading, shrub 2 m x 2 m to 1.5 m high.	Seasonal dampland, grey/brown clayey sand.	Tall Open Scrub of Callitris pyramidalis, Melaleuca viminea, M. osullivanii, M. brevifolia, M. acutifolia over Very Open Sedgeland of Gahnia trifida, Hypolaena exsulca and Juncus kraussii with high cover of Cassytha racemosa.	8 plants in a 0.3 ha area on the SW corner of the block.	Horses on Lot are impacting remnant vegetation.	24/10/2014

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date
2161567	2107	Grevillea thelemanniana	T	Dwarf shrub 30 cm to 100 cm high, with variable habit. Most plants low and prostrate. Foliage blue-green to yellow green.	In winter wet flat on grey sandy loam.	Associated with Actinostrobus pyramidalis, Banksia telmatiaea, Hypocalymma angustifolia, Calothamnus sp.			4/04/1990
2282895	2107	Grevillea thelemanniana	T	Low spreading bush with pinky-red flowers.	On sand.				22/05/1976
2161508	2107	Grevillea thelemanniana	T	Leaves simple or divided, light to mid-green, flowers red.	Sand and clayey sand, low lying flat.	Melaleuca bracteosa Heath A and mixed Low Heath C. Viminaria juncea, Banksia telmatiaea and Hypocalymma angustifolium association.			18/10/1990
5686938	2107	Grevillea thelemanniana	T	Low spreading shrubs 0.2-0.4 m in height. Flowers red.	Winter-wet, swampy area with yellow sand/grey clay soils.	Vegetation consisting of low Myrtaceous shrubs and Banksia, with frequent Actinostrobus pyramidalis, punctuated by open areas with small herbaceous ephemerals.	frequent.		25/09/1999
2161591	2107	Grevillea thelemanniana	T		Brown sandy clay, flat.	With Actinostrobus pyramidalis, Calothamnus hirsutus, Hypocalymma angustifolium, Verticordia plumosa and Melaleuca spp.			31/10/1990
6512631	2107	Grevillea thelemanniana	T	Spreading shrub to 0.3 by 0.7 m; flowers red.	Palusplain; grey clayey sand over clay.	Melaleuca leptoclada Tall Shrubland over Mixed Open Low Heath over Leptocarpus canus Sedgeland.	scattered in Low Heath Layer.		22/06/1995
8436959	2107	Grevillea thelemanniana	T	Widely spreading shrub 0.4-0.8 m high x 0.5-1.5 m wide. Red flowers and divided pinnatisect leaves.	Edge of a seasonal clay based open depression, on slightly deeper sandier soils. Moist grey-brown sandy loam over clay.	Tall shrubland of Melaleuca acutifolia, M. brevifolia and Callitris pyramidalus over Shrubland of Hypocalymma angustifolia, Acacia lasiocarpa, Verticordia densiflora var. densiflora over Very Open Sedgeland of Chaetanthus aristatus and Lepidosperma squam	69 plants.		13/09/2012
1044575	1469	Haemodorum loratum	3	Bracts and bracteoles greenish black, opaque, without conspicuous veining, the margins membranous, white. Outer perianth segments greenish black, glossy, inner segments black, dull, edged with orange. Plants at early flowering stage.	Eastern edge of coastal plain close to foot of Darling Scarp. Grey sand at surface changing to yellowish at about 10 cm deep.	Roadside strip of Jarrah (Eucalyptus marginata) and Banksia woodland with low shrub understorey.		Frequent but many plants vegetative.	19/11/1984

Sheet	NameID	Taxon	Cons_Code	Plant_Desc	Site	Vegetation	Frequency	Notes	Date
7684126	1469	Haemodorum loratum	3		Midslope. Brown sand.	Low Woodland of mixed species including Banksia menziesii, Eucalyptus marginata over Open Low Heath of mixed species dominated by Eremaea pauciflora, Allocasuarina humilis, Xanthorrhoea preissii and Lambertia multiflora var. darlingensis. Associated spec		Healthy population.	23/09/2004
6427634	1469	Haemodorum loratum	3	Annually renewed perennial herb.	Dune Ridge, flat ground, brown sand over yellow sand, well drained.	Associated species: Banksia menziesii.			10/11/1995
1111620	6686	Halgania corymbosa	3	Flowers blue.					/11/1919

Protected Matters Search Tool Report

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 18-Sep-2025

Summary

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	None
Listed Threatened Ecological Communities:	7
Listed Threatened Species:	60
Listed Migratory Species:	26

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	254
Commonwealth Heritage Places:	None
Listed Marine Species:	30
Whales and Other Cetaceans:	None
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	16
Regional Forest Agreements:	1
Nationally Important Wetlands:	2
EPBC Act Referrals:	22
Key Ecological Features (Marine):	None
Biologically Important Areas:	None
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text	Buffer Status
Banksia Woodlands of the Swan Coastal Plain ecological community	Endangered	Community likely to occur within area	In feature area
Clay Pans of the Swan Coastal Plain	Critically Endangered	Community likely to occur within area	In buffer area only
Corymbia calophylla - Kingia australis woodlands on heavy soils of the Swan Coastal Plain	Endangered	Community known to occur within area	In buffer area only
Empodisma peatlands of southwestern Australia	Endangered	Community may occur within area	In feature area
Shrublands and Woodlands of the eastern Swan Coastal Plain	Endangered	Community known to occur within area	In buffer area only
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area	In buffer area only
Tuart (Eucalyptus gomphocephala) Woodlands and Forests of the Swan Coastal Plain ecological community	Critically Endangered	Community may occur within area	In feature area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text	Buffer Status
BIRD			
Botaurus poiciloptilus			
Australasian Bittern [1001]	Endangered	Species or species habitat likely to occur within area	In feature area
Calidris acuminata			
Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area	In feature area
Calyptorhynchus banksii naso Forest Red-tailed Black-Cockatoo, Karrak [67034]	Vulnerable	Species or species habitat known to occur within area	In feature area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat may occur within area	In buffer area only
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Leipoa ocellata Malleefowl [934]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In buffer area only
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In buffer area only
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area	In feature area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Phaethon rubricauda westralis Red-tailed Tropicbird (Indian Ocean), Indian Ocean Red-tailed Tropicbird [91824]	Endangered	Species or species habitat may occur within area	In buffer area only
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area	In feature area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Thalassarche cauta Shy Albatross [89224]	Endangered	Species or species habitat may occur within area	In buffer area only
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In buffer area only
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area	In feature area
Zanda baudinii listed as Calyptorhynchus baudinii Baudin's Cockatoo, Baudin's Black-Cockatoo, Long-billed Black-cockatoo [87736]	Endangered	Roosting known to occur within area	In feature area
Zanda latirostris listed as Calyptorhynchus latirostris Carnaby's Black Cockatoo, Short-billed Black-cockatoo [87737]	Endangered	Breeding known to occur within area	In feature area
INSECT			
Leioproctus douglasiellus a short-tongued bee [66756]	Critically Endangered	Species or species habitat may occur within area	In buffer area only
MAMMAL			

Scientific Name	Threatened Category	Presence Text	Buffer Status
[Bettongia penicillata ogilbyi](#) Woylie [66844]	Endangered	Species or species habitat may occur within area	In buffer area only
[Dasyurus geoffroii](#) Chuditch, Western Quoll [330]	Vulnerable	Species or species habitat known to occur within area	In feature area
[Setonix brachyurus](#) Quokka [229]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
OTHER			
[Westralunio carteri](#) Carter's Freshwater Mussel, Ambiguus Mussel [86266]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
PLANT			
[Acacia anomala](#) Grass Wattle, Chittering Grass Wattle [8153]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
[Acacia aphylla](#) Leafless Rock Wattle [13553]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
[Andersonia gracilis](#) Slender Andersonia [14470]	Endangered	Species or species habitat likely to occur within area	In feature area
[Anigozanthos viridis subsp. terraspectans](#) Dwarf Green Kangaroo Paw [3435]	Vulnerable	Species or species habitat may occur within area	In buffer area only
[Anthocercis gracilis](#) Slender Tailflower [11103]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
[Banksia mimica](#) Summer Honeypot [82765]	Endangered	Species or species habitat likely to occur within area	In feature area
[Calytrix breviseta subsp. breviseta](#) Swamp Starflower [23879]	Endangered	Species or species habitat likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Chamelaucium lullfitzii listed as Chamelaucium sp. Gingin (N.G.Marchant 6)			
Gingin Wax [92777]	Endangered (listed as Chamelaucium sp. Gingin	Species or species habitat may occur within area	In feature area
Conospermum undulatum			
Wavy-leaved Smokebush [24435]	Vulnerable	Species or species habitat known to occur within area	In feature area
Darwinia apiculata			
Scarp Darwinia [8763]	Endangered	Species or species habitat known to occur within area	In buffer area only
Diplolaena andrewsii			
[6601]	Endangered	Species or species habitat likely to occur within area	In feature area
Diuris drummondii			
Tall Donkey Orchid [4365]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Diuris micrantha			
Dwarf Bee-orchid [55082]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Diuris purdiei			
Purdie's Donkey-orchid [12950]	Endangered	Species or species habitat likely to occur within area	In feature area
Drakaea elastica			
Glossy-leafed Hammer Orchid, Glossy-leaved Hammer Orchid, Warty Hammer Orchid [16753]	Endangered	Species or species habitat likely to occur within area	In feature area
Drakaea micrantha			
Dwarf Hammer-orchid [56755]	Vulnerable	Species or species habitat may occur within area	In feature area
Eleocharis keigheryi			
Keighery's Eleocharis [64893]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Eremophila glabra subsp. chlorella			
[84927]	Endangered	Species or species habitat likely to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Eucalyptus x balanites			
Cadda Road Mallee, Cadda Mallee [87816]	Endangered	Species or species habitat may occur within area	In feature area
Grevillea curviloba subsp. incurva			
Narrow curved-leaf Grevillea [64909]	Endangered	Species or species habitat may occur within area	In feature area
Grevillea flexuosa			
Zig Zag Grevillea [2957]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Macarthuria keigheryi			
Keighery's Macarthuria [64930]	Endangered	Species or species habitat known to occur within area	In feature area
Morelotia australiensis listed as Tetraria australiensis			
Southern Tetraria [92784]	Vulnerable	Species or species habitat may occur within area	In feature area
Synaphea sp. Fairbridge Farm (D.Papenfus 696)			
Selena's Synaphea [82881]	Critically Endangered	Species or species habitat likely to occur within area	In feature area
Thelymitra dedmaniarum			
Cinnamon Sun Orchid [65105]	Endangered	Species or species habitat may occur within area	In feature area
Thelymitra stellata			
Star Sun-orchid [7060]	Endangered	Species or species habitat known to occur within area	In feature area
Trithuria occidentalis			
Swan Hydatella [42224]	Endangered	Species or species habitat likely to occur within area	In buffer area only
REPTILE			
Caretta caretta			
Loggerhead Turtle [1763]	Endangered	Species or species habitat known to occur within area	In buffer area only
Chelonia mydas			
Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Dermochelys coriacea			
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area	In buffer area only
Natator depressus			
Flatback Turtle [59257]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
SHARK			
Sphyrna lewini			
Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat likely to occur within area	In buffer area only

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text	Buffer Status
Migratory Marine Birds			
Apus pacificus			
Fork-tailed Swift [678]		Species or species habitat likely to occur within area	In feature area
Diomedea amsterdamensis			
Amsterdam Albatross [64405]	Endangered	Species or species habitat may occur within area	In buffer area only
Diomedea epomophora			
Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Diomedea exulans			
Wandering Albatross [89223]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Macronectes giganteus			
Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In buffer area only
Macronectes halli			
Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In buffer area only
Phaethon rubricauda			
Red-tailed Tropicbird [994]		Species or species habitat may occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Thalassarche cauta			
Shy Albatross [89224]	Endangered	Species or species habitat may occur within area	In buffer area only
Thalassarche impavida			
Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Thalassarche melanophris			
Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In buffer area only
Thalassarche steadi			
White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Migratory Marine Species			
Caretta caretta			
Loggerhead Turtle [1763]	Endangered	Species or species habitat known to occur within area	In buffer area only
Chelonia mydas			
Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Dermochelys coriacea			
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area	In buffer area only
Mobula alfredi as Manta alfredi			
Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat may occur within area	In buffer area only
Mobula birostris as Manta birostris			
Giant Manta Ray [90034]		Species or species habitat may occur within area	In buffer area only
Natator depressus			
Flatback Turtle [59257]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Migratory Terrestrial Species			
Motacilla cinerea			
Grey Wagtail [642]		Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Migratory Wetlands Species			
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area	In feature area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area	In feature area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area	In feature area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat likely to occur within area	In feature area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area	In feature area
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area	In feature area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area	In feature area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Commonwealth Land Name	State	Buffer Status

Listed Marine Species			[Resource Information]
Scientific Name	Threatened Category	Presence Text	Buffer Status
Bird			
Actitis hypoleucos			
Common Sandpiper [59309]		Species or species habitat known to occur within area	In feature area
Apus pacificus			
Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area	In feature area
Bubulcus ibis as Ardea ibis			
Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area	In feature area
Calidris acuminata			
Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area	In feature area
Calidris ferruginea			
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area overfly marine area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat likely to occur within area overfly marine area	In feature area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat may occur within area	In buffer area only
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat likely to occur within area	In feature area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In buffer area only
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In buffer area only
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area	In feature area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area overfly marine area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area	In feature area
Pachyptila turtur Fairy Prion [1066]		Species or species habitat likely to occur within area	In buffer area only
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area	In feature area
Phaethon rubricauda Red-tailed Tropicbird [994]		Species or species habitat may occur within area	In buffer area only
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area	In feature area
Thalassarche cauta Shy Albatross [89224]	Endangered	Species or species habitat may occur within area	In buffer area only
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In buffer area only
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Thinornis cucullatus as Thinornis rubricollis Hooded Plover, Hooded Dotterel [87735]		Species or species habitat likely to occur within area overfly marine area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area overfly marine area	In feature area
Reptile			
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat known to occur within area	In buffer area only
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area	In buffer area only
Natator depressus Flatback Turtle [59257]	Vulnerable	Species or species habitat known to occur within area	In buffer area only

Berkshire Road and Roe Highway Interchange, Forrestfield, East Perth, WA	2014/7243	Not Controlled Action	Completed	In buffer area only
Forrestfield Airport Link, WA	2015/7399	Not Controlled Action	Completed	In buffer area only
Improving rabbit biocontrol: releasing another strain of RHDV, sthrn two thirds of Australia	2015/7522	Not Controlled Action	Completed	In feature area
INDIGO Central Submarine Telecommunications Cable	2017/8127	Not Controlled Action	Completed	In feature area
Pipeline Extension, Hazelmere and Helena Valley, WA	2018/8239	Not Controlled Action	Completed	In buffer area only
Residential development of Lots 302, 308, 320 and part of Lot 9502, Hawtin Rd, Forrestfield, WA	2016/7770	Not Controlled Action	Completed	In buffer area only
Ridge Hill Road intersection modification and offsite water main installation, Gooseberry Hill, WA	2020/8842	Not Controlled Action	Completed	In buffer area only
Roe Highway Noise Wall, High Wycombe, WA	2014/7149	Not Controlled Action	Completed	In buffer area only
Tonkin Highway Upgrade, Guildford Road to Great Eastern Highway, WA	2019/8545	Not Controlled Action	Completed	In buffer area only
Not controlled action (particular manner)				
Commercial Estate and Aeronautical Infrastructure Development, Precincts 2A & 2B	2006/3021	Not Controlled Action (Particular Manner)	Post-Approval	In buffer area only
South West Metropolitan Railway Project	2003/1175	Not Controlled Action (Particular Manner)	Post-Approval	In buffer area only

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data is available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance on the contents of this report.

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions when time permits.

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded breeding sites; and
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

APPENDIX 7

Conservation Codes

Conservation Codes for Western Australian Flora and Fauna

Threatened, Extinct and Specially Protected fauna or flora are species which have been adequately searched for and are deemed to be, in the wild, threatened, extinct or in need of special protection, and have been gazetted as such.

The lists of Threatened, Extinct and Specially Protected species are listed under Part 2 of the Biodiversity Conservation Act 2016.

Categories of Threatened, Extinct and Specially Protected fauna and flora are:

T Threatened species

Listed by order of the Minister as Threatened in the category of critically endangered, endangered or vulnerable under section 19(1), or is a rediscovered species to be regarded as threatened species under section 26(2) of the *Biodiversity Conservation Act 2016* (BC Act).

> ***Threatened fauna*** is the species of fauna that are listed as critically endangered, endangered or vulnerable threatened species.
>
> ***Threatened flora*** is the species of flora that are listed as critically endangered, endangered or vulnerable threatened species.

The assessment of the conservation status of threatened species is in accordance with the BC Act listing criteria and the requirements of Ministerial Guideline (Number 1) and Ministerial Guideline (Number 2) that adopts the use of the International Union for Conservation of Nature (IUCN) Red List of Threatened Species Categories and Criteria 4, and is based on the national distribution of the species.

CR Critically endangered species

> Threatened species considered to be "*facing an extremely high risk of extinction in the wild in the immediate future, as determined in accordance with criteria set out in the ministerial guidelines*".
>
> Listed as critically endangered under section 19(1)(a) of the BC Act in accordance with the criteria set out in section 20 and the ministerial guidelines.

EN Endangered species

> Threatened species considered to be "*facing a very high risk of extinction in the wild in the near future, as determined in accordance with criteria set out in the ministerial guidelines*".
>
> Listed as endangered under section 19(1)(b) of the BC Act in accordance with the criteria set out in section 21 and the ministerial guidelines.

VU Vulnerable species

> Threatened species considered to be "*facing a high risk of extinction in the wild in the medium-term future, as determined in accordance with criteria set out in the ministerial guidelines*".

Listed as vulnerable under section 19(1)(c) of the BC Act in accordance with the criteria set out in section 22 and the ministerial guidelines.

Extinct Species

EX Presumed extinct species

Species where "*there is no reasonable doubt that the last member of the species has died*", and listing is otherwise in accordance with the ministerial guidelines (section 24 of the BC Act).

EW Extinct in the wild species

Species that "*is known only to survive in cultivation, in captivity or as a naturalised population well outside its past range; and it has not been recorded in its known habitat or expected habitat, at appropriate seasons, anywhere in its past range, despite surveys over a time frame appropriate to its life cycle and form*", and listing is otherwise in accordance with the ministerial guidelines (section 25 of the BC Act).

Currently there are no threatened fauna or threatened flora species listed as extinct in the wild. If listing of a species as extinct in the wild occurs, then a schedule will be added to the applicable notice.

Specially protected species

Listed by order of the Minister as specially protected under section 13(1) of the BC Act. Meeting one or more of the following categories: species of special conservation interest; migratory species; cetaceans; species subject to international agreement; or species otherwise in need of special protection.

Species that are listed as threatened species (critically endangered, endangered or vulnerable) or extinct species under the BC Act cannot also be listed as Specially Protected species.

MI Migratory species

Fauna that periodically or occasionally visit Australia or an external Territory or the exclusive economic zone; or the species is subject of an international agreement that relates to the protection of migratory species and that binds the Commonwealth; and listing is otherwise in accordance with the ministerial guidelines (section 15 of the BC Act).

Includes birds that are subject to an agreement between the government of Australia and the governments of Japan (JAMBA), China (CAMBA) and The Republic of Korea (ROKAMBA), and fauna subject to the Convention on the Conservation of Migratory Species of Wild Animals (Bonn Convention), an environmental treaty under the United Nations Environment Program. Migratory species listed under the BC Act are a subset of the migratory animals, that are known to visit Western Australia, protected under the international agreements or treaties, excluding species that are listed as Threatened species.

CD Species of special conservation interest (conservation dependent fauna)

Fauna of special conservation need being species dependent on ongoing conservation intervention to prevent it becoming eligible for listing as threatened, and listing is otherwise in accordance with the ministerial guidelines (section 14 of the BC Act).

Currently only fauna are listed as species of special conservation interest.

OS Other specially protected species

Fauna otherwise in need of special protection to ensure their conservation, and listing is otherwise in accordance with the ministerial guidelines (section 18 of the BC Act).

Currently only fauna are listed as species otherwise in need of special protection.

P Priority species

Priority is not a listing category under the BC Act.

All fauna and flora are protected in WA following the provisions in Part 10 of the BC Act. The protection applies even when a species is not listed as threatened or specially protected, and regardless of land tenure (State managed land (Crown land), private land, or Commonwealth land).

Species that may possibly be threatened species that do not meet the criteria for listing under the BC Act because of insufficient survey or are otherwise data deficient, are added to the Priority Fauna or Priority Flora Lists under Priorities 1, 2 or 3. These three categories are ranked in order of prioritisation for survey and evaluation of conservation status so that consideration can be given to potential listing as threatened.

Species that are adequately known, meet criteria for near threatened, or are rare but not threatened, or that have been recently removed from the threatened species list or conservation dependent or other specially protected fauna lists for other than taxonomic reasons, are placed in Priority 4. These species require regular monitoring.

Assessment of priority status is based on the Western Australian distribution of the species, unless the distribution in WA is part of a contiguous population extending into adjacent States, as defined by the known spread of locations.

Priority 1: Poorly-known species

Species that are known from one or a few locations (generally five or less) which are potentially at risk. All occurrences are either: very small; or on lands not managed for conservation, for example, agricultural or pastoral lands, urban areas, road and rail reserves, gravel reserves and active mineral leases; or otherwise under threat of habitat destruction or degradation.

Species may be included if they are comparatively well known from one or more locations but do not meet adequacy of survey requirements for threatened listing and appear to be under immediate threat from known threatening processes. These species are in urgent need of further survey.

Priority 2: Poorly-known species

Species that are known from one or a few locations (generally five or less), some of which are on lands managed primarily for nature conservation, for example, national parks, conservation parks, nature reserves and other lands with secure tenure being managed for conservation.

Species may be included if they are comparatively well known from one or more locations but do not meet adequacy of survey requirements for threatened listing and appear to be under threat from known threatening processes. These species are in urgent need of further survey.

Priority 3: Poorly-known species

Species that are known from several locations and the species does not appear to be under imminent threat or from few but widespread locations with either large population size or significant remaining areas of apparently suitable habitat, much of it not under imminent threat.

Species may be included if they are comparatively well known from several locations but do not meet adequacy of survey requirements and known threatening processes exist that could affect them. These species need further survey.

Priority 4: Rare, Near Threatened and other species in need of monitoring

(a) Rare. Species that are considered to have been adequately surveyed, or for which sufficient knowledge is available, and that are considered not currently threatened or in need of special protection but could be if present circumstances change. These species are usually represented on conservation lands.

(b) Near Threatened. Species that are considered to have been adequately surveyed and that are close to qualifying for vulnerable but are not listed as a conservation dependent specially protected species.

(c) Species that have been removed from the list of threatened species or lists of conservation dependent or other specially protected species, during the past five years for reasons other than taxonomy.

(d) Other species in need of monitoring.

Western Australian Ecological Communities

<u>Threatened Ecological Communities</u>

The BC Act provides for the statutory listing of threatened ecological communities (TECs) by the Minister.

Presumed Totally Destroyed (PD)

An ecological community that has been adequately searched for but for which no representative occurrences have been located. The community has been found to be totally

destroyed or so extensively modified throughout its range that no occurrence of it is likely to recover its species composition and/or structure in the foreseeable future.

Critically Endangered (CR)

An ecological community that has been adequately surveyed and found to have been subject to a major contraction in area and/or that was originally of limited distribution and is facing severe modification or destruction throughout its range in the immediate future, or is already severely degraded throughout its range but capable of being substantially restored or rehabilitated.

Endangered (EN)

An ecological community that has been adequately surveyed and found to have been subject to a major contraction in area and/or was originally of limited distribution and is in danger of significant modification throughout its range or severe modification or destruction over most of its range in the near future.

Vulnerable (VU)

An ecological community that has been adequately surveyed and is found to be declining and/or has declined in distribution and/or condition and whose ultimate security has not yet been assured and/or a community that is still widespread but is believed likely to move into a category of higher threat in the near future if threatening processes continue or begin operating throughout its range.

Priority Ecological Communities

Possible threatened ecological communities that do not meet survey criteria or that are not adequately defined are added to the Priority Ecological Community List under priorities 1, 2 and 3. These three categories are ranked in order of priority for survey and/or definition of the community. Ecological communities that are adequately known, and are rare but not threatened or meet criteria for Near Threatened, or that have been recently removed from the threatened list, are placed in Priority 4. These ecological communities require regular monitoring. Conservation Dependent ecological communities are placed in Priority 5.

Priority One: Poorly-known ecological communities

Ecological communities that are known from very few occurrences with a very restricted distribution (generally ≤5 occurrences or a total area of ≤ 100ha).

Occurrences are believed to be under threat either due to limited extent, or being on lands under immediate threat (e.g. within agricultural or pastoral lands, urban areas, active mineral leases) or for which current threats exist. May include communities with occurrences on protected lands. Communities may be included if they are comparatively well-known from one or more localities but do not meet adequacy of survey requirements, and/or are not well defined, and appear to be under immediate threat from known threatening processes across their range.

Priority Two: Poorly-known ecological communities

Communities that are known from few occurrences with a restricted distribution (generally ≤10 occurrences or a total area of ≤200ha). At least some occurrences are not believed to be under immediate threat (within approximately 10 years) of destruction or degradation. Communities may be included if they are comparatively well known from one or more localities but do not meet adequacy of survey requirements, and/or are not well defined, and appear to be under threat from known threatening processes.

Priority Three: Poorly known ecological communities

(i) Communities that are known from several to many occurrences, a significant number or area of which are not under threat of habitat destruction or degradation or:

(ii) communities known from a few widespread occurrences, which are either large or with significant remaining areas of habitat in which other occurrences may occur, much of it not under imminent threat (within approximately 10 years), or;

(iii) munities made up of large, and/or widespread occurrences, that may or may not be represented in the reserve system, but are under threat of modification across much of their range from processes such as grazing by domestic and/or feral stock, inappropriate fire regimes, clearing, hydrological change etc.

Communities may be included if they are comparatively well known from several localities but do not meet adequacy of survey requirements and/or are not well defined, and known threatening processes exist that could affect them.

Priority Four: Ecological communities that are adequately known, rare but not threatened or meet criteria for Near Threatened, or that have been recently removed from the threatened list. These communities require regular monitoring.

(i) Rare. Ecological communities known from few occurrences that are considered to have been adequately surveyed, or for which sufficient knowledge is available, and that are considered not currently threatened or in need of special protection, but could be if present circumstances change. These communities are usually represented on conservation lands.

(ii) Near Threatened. Ecological communities that are considered to have been adequately surveyed and that do not qualify for Conservation Dependent, but that are close to qualifying for a higher threat category.

(iii) Ecological communities that have been removed from the list of threatened communities during the past five years.

Priority Five: Conservation Dependent ecological communities

Ecological communities that are not threatened but are subject to a specific conservation program, the cessation of which would result in the community becoming threatened within five years.

Commonwealth of Australia Conservation Codes

Threatened Flora and Fauna

Threatened fauna and flora may be listed under Section 178 of the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) in any one of the following six categories:

Extinct

A native species is eligible to be included in the extinct category at a particular time if, at that time, there is no reasonable doubt that the last member of the species has died.

Extinct in the wild

A native species is eligible to be included in the extinct in the wild category at a particular time if, at that time:

a) it is known only to survive in cultivation, in captivity or as a naturalised population well outside its past range; or
b) it has not been recorded in its known and/or expected habitat, at appropriate seasons, anywhere in its past range, despite exhaustive surveys over a time frame appropriate to its life cycle and form.

Critically endangered

A taxon is Critically Endangered when the best available evidence indicates that it meets any of the five criteria for the category identified in Part 7.01 of the EPBC Regulations, and it is therefore considered to be facing an extremely high risk of extinction in the wild.

Endangered

A taxon is Endangered when the best available evidence indicates that it meets any of the five criteria for the category identified in Part 7.01 of the EPBC Regulations, and it is therefore considered to be facing a very high risk of extinction in the wild.

Vulnerable

A taxon is Vulnerable when the best available evidence indicates that it meets any of the five criteria for the category identified in Part 7.01 of the EPBC Regulations, and it is therefore considered to be facing a high risk of extinction in the wild.

Conservation dependent

A native species is eligible to be included in the conservation dependent category at a particular time if, at that time:

a) the species is the focus of a specific conservation program the cessation of which would result in the species becoming vulnerable, endangered or critically endangered; or
b) the following subparagraphs are satisfied:
    i. the species is a species of fish;

ii. the species is the focus of a plan of management that provides for management actions necessary to stop the decline of, and support the recovery of, the species so that its chances of long term survival in nature are maximised;
iii. the plan of management is in force under a law of the Commonwealth or of a State or Territory;
iv. cessation of the plan of management would adversely affect the conservation status of the species.

The EPBC Act does not provide for listing in a data deficient category. Where sufficient data (evidence) is unavailable to allow assessment by the Threatened Species Scientific Committee against the criteria for listing, the species are found to be ineligible. A recommendation is made to the Minister to not include the species in any category under the EPBC Act. For reasons of transparency and to inform future research, the Threatened Species Scientific Committee publishes the names of those species found to be data deficient. As data deficient is not a listing category under the EPBC Act, this has no statutory implications and the species is not considered to be listed under the EPBC Act.

Threatened Ecological Communities

Threatened Ecological communities under the EPBC Act are listed in three categories.

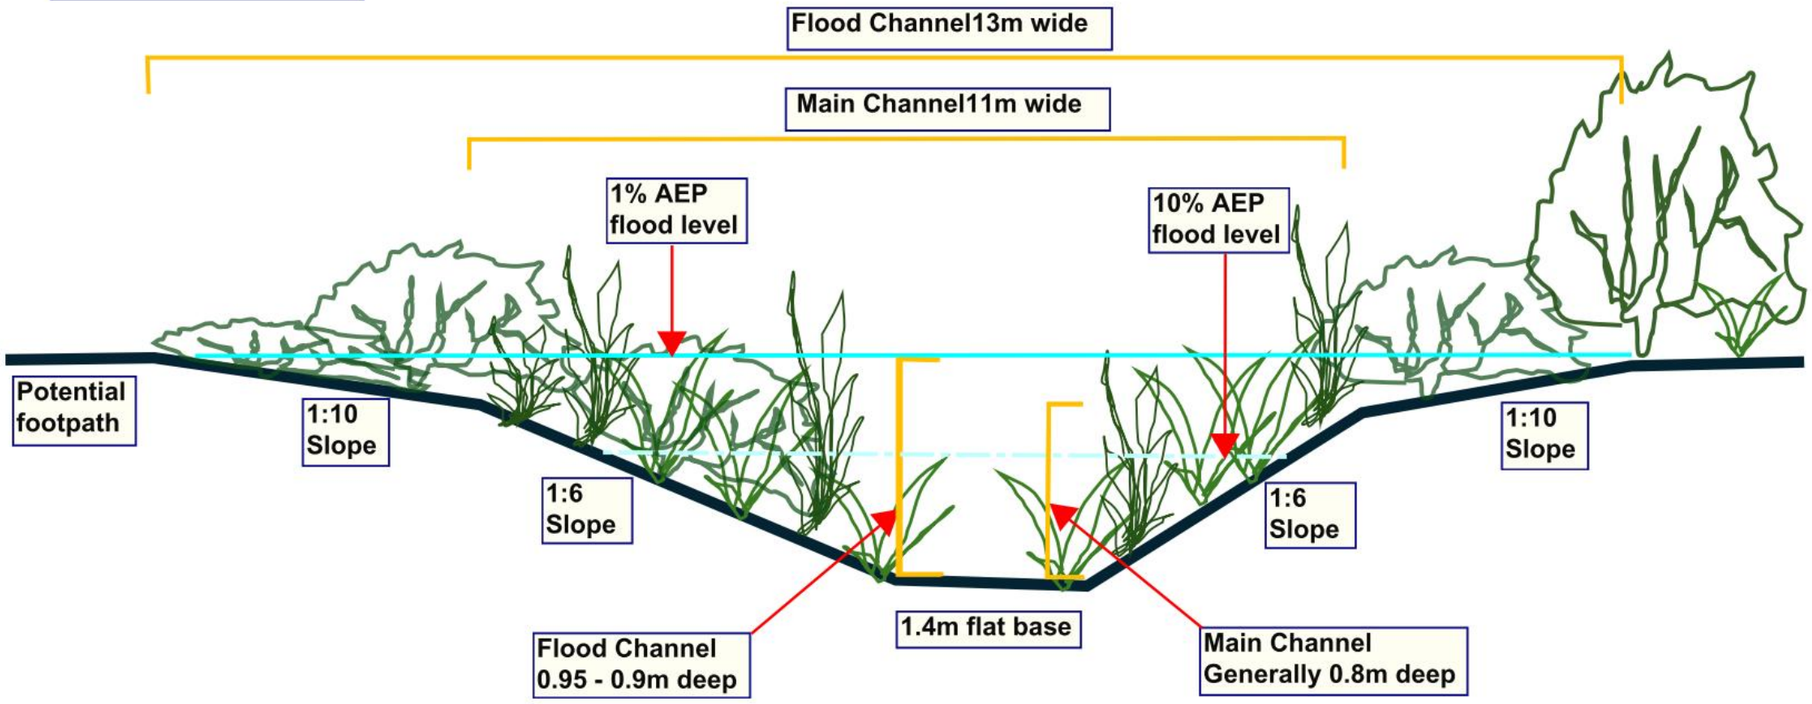
Critically endangered

If, at that time, an ecological community is facing an extremely high risk of extinction in the wild in the immediate future (indicative timeframe being the next 10 years).

Endangered

If, at that time, an ecological community is not critically endangered but is facing a very high risk of extinction in the wild in the near future (indicative timeframe being the next 20 years).

Vulnerable



If, at that time, an ecological community is not critically endangered or endangered, but is facing a high risk of extinction in the wild in the medium–term future (indicative timeframe being the next 50 years).

Standard Geotechnical Definitions, Recommendations, Requirements and Limitations

1. INTRODUCTION

This report presents the outcomes of Galt Geotechnics' (Galt's) geotechnical and acid sulfate soils (ASS) study for the proposed Hatch Court Light Industrial Area (HCLIA) and Stirling Crescent Precinct (SCP), at Hatch Court and Stirling Crescent, High Wycombe ("the site").

This report is to be read in conjunction with the appended "Geotechnical Definitions, Recommendations, Requirements and Limitations". 'Clause GDR1', etc. refer to this Appendix, found at the back of this report.

2. KEY FINDINGS

Over most of both sites, **we encountered SAND, extending to depths of 2.0 m to over 6.2 m, overlying Guildford Formation** (interbedded stiff to hard cohesive soils and medium dense granular soils) at some locations extending beyond investigated depths. In addition to the above:

- The surficial **sand is interbedded with Cemented sand / 'Coffee Rock' layers** (about 0.3 m to 1.0 m thick) below about 2.0 m to 3.4 m depth. Associated uncemented zones of discoloured brown / black sand with a higher fines content were also encountered in some locations.
- **Peat / organic soils were encountered** within / adjacent the drainage line in the northern part of the HCLIA site, and within the wetland area near Lewis Road (refer Figure 1). Similar zones of organic soils could be present in lakes at the site (refer Figure 1).
- **Surficial uncontrolled fill about 1.1 m thick was encountered** in the northern corner of site at 27 Hatch Court within the HCLIA (refer Galt report referenced: WAG250256-01 001 R Rev1).

The locations of encountered coffee rock, Guildford Formation and organic soils are summarised in Attached Tables 3 to 7.

Groundwater was encountered at depths ranging from the ground surface to over 3 m. Groundwater was also observed in lakes in southern part of each site, and along drainage line in northern part of HCLIA site.

The sites are considered broadly geotechnically suitable for the proposed development (LSP amendment to industrial use). Standard site preparation measures for sand sites will apply for most of the site area. However, geotechnical challenges relevant to the proposed development are summarised as follows:

- **Peat / organic soils must be removed** if these areas are to be developed. Removal of these soils is likely to require dewatering. Management / treatment of organic / acid sulfate generating soils and acidic groundwater could also possibly be required (refer Section 12);
- **Cemented sand / 'Coffee Rock' layers could have a low permeability**, which could impact the performance of soakwells. Coffee rock also has the potential to be acid generating (if removed) and would require treatment (refer Section 12);
- **Areas of shallow groundwater have been identified** in lower lying areas. Shallow groundwater will impact temporary excavations, and compaction during construction. Dewatering is likely to be required, particularly if construction is undertaken during winter. The potential requirement for and ASSDMP is discussed in Section 12. Shallow groundwater will affect the performance of soakwells and effluent disposal. Control of groundwater levels at the site must be assessed by a suitably qualified civil engineer / hydrogeologist. Subsoil drainage could possibly be required;
- **Surficial uncontrolled fill in the northern corner of the site must be removed**, assessed by a suitably qualified engineer and environmental scientist (refer Section 12), and either removed from site, or (if suitable) reused as approved fill; and
- **Environmental considerations are** discussed in Section 12.

We do not consider that the sites are geotechnically unusual in the context of the nearby area and similar industrial developments. We do not consider that there are any major contamination encumbrances to a proposed rezoning.

3. SITE DESCRIPTION

Table 1: Summary of Site

Item	Comment
Site Extent	Refer to In-line Image 1.
Site Area	Hatch Court Light Industrial Area (HCLIA): ~30 ha (16 lots). Stirling Crescent Precinct (SCP): ~6 ha (11 lots).
Current Site Surface Elevation[1]	Around RL 20 m AHD at the north to RL 24 m AHD at the south.
Vegetation	Vegetation present in landscaped areas surrounding houses and associated infrastructure. Vegetation includes grassed areas, some mature trees and some bushes (refer Figure 1). Dense vegetation along drainage line in northern part of HCLIA site.
Current Land Use	Mostly rural-residential developments and associated infrastructure. South west part of site (Lots 614 and 584) is a hardstand area (refer Figure 1).
Site drainage	Drainage line traverses from west to east in northern part of HCLIA site. Wetland area present in western corner of HCLIA site near Lewis Road. Several damp lands are apparent from historical aerial photos (refer In-line Image 2). Localised lakes are present in southern part of both the HCLIA and SCP sites, which are judged to be expressions of groundwater.
Site History[2]	**Prior to 1979**: Site mostly pastoral / agricultural land. Three residences developed on site. **1979 to 1983**: Development of residential buildings in SCP. **1983 to 1995**: Development of Hatch Court. And associated residential lots / developments. **1995 to 2018**: Site relatively unchanged. Some additional residential buildings and associated infrastructure constructed progressively during this time. **2018**: to Construction of hardstand in western corner of site. **2018 to 2024**: progressive construction of hardstand in western part of site (Lots 614 and 584).

NOTES: ***1.*** *Site elevation based on publicly available data (Landgate).*

2. *Site history based on aerial imagery (Landgate).*

In-line Image 1: Approximate extent of subject area

In-line Image 2: Aerial photo of site in 1961. HCLA marked in red/yellow.

4. PROPOSED DEVELOPMENT

Table 2: Summary of Proposed Development

Item	Comment
Proposed Development	LSP amendment to facilitate subdivision of industrial lots with associated infrastructure
Cut/Fill	Assumed typically up to about ± 1 m. Fill is generally anticipated to be required in low lying areas to achieve adequate clearance to groundwater.
Assumed Retaining Walls	Gravity walls up to about 2 m high
Assumed Stormwater Disposal	Possibly on site via soakwells with overflow to regional drainage.
Assumed Sewage Disposal	On site via leach drains

5. PROJECT OBJECTIVES

The objective of the geotechnical study is to assess the geotechnical suitability of the site for the proposed development. Our scope is limited to undeveloped portion of the HCLIA (i.e. excludes Lots 614 and 584)) and entirety of the SCP.

The objectives of the environmental assessment are to investigate the risk of acid sulfate soils (ASS) across the site through soil and groundwater analysis and provided recommendation for the treatment of ASS of groundwater (if required). No specific infrastructure is proposed at this stage, therefore the assessment is high level for the general assessment of ASS.

Comment is also required on the potential contamination risk within the HCLIA and SCP.

6. PREVIOUS STUDIES

Galt has previously undertaken a number of geotechnical studies for individual lots within and adjacent the site as summarised below:

- **Located within site:**
  - 27 Hatch Court in May 2025 (report reference: WAG250256-01 001 R Rev1);
  - Lots 8 and 16 Stirling Crescent in November 2024 (report reference: WAG240438-01 001 R Rev2);
- ***Located north of site / not within site:***
  - 71 Stirling Crescent in March 2023 (report reference: WAG230133-01 001 R Rev1); and
  - Part of Lot 1499 Stirling Crescent in September 2023 (report reference: WAG230463-01 002 R Rev1).

Test locations from the above reports are shown on Figure 1. Relevant information from the above studies are incorporated into this report.

7. FIELDWORK

7.1. General

Fieldwork was carried out on 25 August and 05 September 2025 and is summarised below.

Table 3: Summary of Fieldwork

Type	Results Appendix	Summary	GDR Clause	Equipment Used	No. Tests	Depth Range (m)
Site Plan	Figure 1	-	-	Hand held GPS[1]	-	-
Photographs	A	-	-	-	-	-
Cone Penetration Tests (CPTs)	B	Section 9.4	GDR3.2	Pagani TG 73-200	16	2.34 to 5.20
Boreholes (BH)	C	Section 9.4	GDR3.3	EVH Scout on utility / 7822DT / Hand Auger	14	1.30 to 3.00
Monitoring Wells (MW)	C	Section 7.3	-	7822DT	3[2]	3.00
Constant Head Permeameter Tests (G)	D	Section 7.2	GDR3.8	Guelph Permeameter	7	0.38 to 0.57

NOTES: ***1.*** *Hand held GPS is accurate to ±5 m.*

2. *One groundwater monitoring well location was unavailable for sampling after installation.*

7.2. Permeability Test Results

Table 4: Permeability Test Results (Constant Head)

Test Location	Soil Description	Depth (m)	Minimum Saturated Hydraulic Conductivity, k_{sat} (m/day)	Soil Category[2]

NOTES: ***1.*** *Soil type is as per Table 5.2 of AS1547-2012*

2. *Test method described in GDR3.7.*

3. *Test results likely to have been influenced by shallow groundwater*

7.3. Soil Sampling

Soil samples for the ASS study were collected from selected boreholes in accordance with the following guidelines:

- Department of Environmental Regulation (DER) (2015) *Identification and Investigation of Acid Sulfate Soils and Acidic Landscapes and;*
- Department of Agriculture and Water Resources (DAWR) (2018) National Acid Sulfate Soils Guidance.

Samples collected for acid sulfate soils testing were collected at 0.25 m intervals using dedicated nitrile gloves and placed in laboratory-supplied sample bags. The samples were then placed in an ice chilled cooler in the field, and then transferred to a freezer until field testing was undertaken. All samples scheduled for analysis were transported to the laboratory with sufficient packaging and ice to ensure preservation of sample integrity. The lateral borehole distribution is considered appropriate for the project and in accordance with the aforementioned regulatory guidelines.

7.4. Acid Sulfate Soil Field Testing

A small portion of each soil sample was tested for pH before (pH_F) and after (pH_{FOX}) rapid oxidation with hydrogen peroxide (H_2O_2). The samples were then placed in an ice chilled cooler until submission to the laboratory for chromium reducible sulfur (CRS) analysis.

Samples with field pH values (pH_F) of <3 to 4 indicate the presence of ASS, thus indicating acids in the soil profile have oxidised.

The presence of unoxidized acids or potential acid sulfate soil (PASS) is indicated if:

- a strong reaction with hydrogen peroxide is observed;
- the pH_{FOX} is at least 1 pH unit below pH_F; or
- the pH_{FOX} is <3 to 4 and one or both of the above conditions apply.

The texture based net acidity action criteria presented in the DER (2015) *Identification and Investigation of Acid Sulfate Soils and Acidic Landscapes* guideline document specifies a value of 0.03 %S based on the anticipated volume of soil to be disturbed being greater than 1,000 tonnes. This value has been adopted for the assessment of net acidity in soils across the site.

7.5. Groundwater Monitoring Wells

Groundwater monitoring wells were installed in boreholes drilled Geoprobe 6620 DT drill rig supplied and operated by Direct Push Probing.

Wells were constructed using 50 mm, class 18 flush-threaded PVC with a 2.5 m screened interval was installed at the base of each well and finished with approximate 0.6 to 0.7 m solid section extending to the surface. Refer to Appendix C for more information on construction details for each well.

A submersible pump was used to remove fine sediments and filter sand from the well. Groundwater levels were measured more than 7 days after installation and development to allow the water in the well to reach hydrostatic levels (refer Attached Table 3).

7.6. Groundwater Sampling

The groundwater wells were sampled in accordance with the following Australian Standards:

- AS/NZS 5667.1:1998 Water Quality Sampling. Part I – Guidance on the Design of Sampling Programs, Sampling Techniques and the Preservation and Handling of Samples; and
- AS/NZS 5667.11:1998 Water Quality Sampling. Part II – Guidance on the Sampling of Groundwater. Groundwater samples were recovered using low-flow methods.

The pump was set at the centre of the screened interval and drawdown measured concurrently whilst pumping to ensure the pump flow rates were less than the recharge capacity of the well. An initial flow rate in the order of 0.5-1.0 L/min was used and adjusted as appropriate to ensure minimal drawdown (<0.1m) during purging. New nitrile disposable gloves were used at each monitoring well location.

Representative samples for laboratory analysis were collected after stabilisation of groundwater physio-chemical parameters was achieved. Measurements of these parameters including temperature, pH, electrical conductivity, redox potential and dissolved oxygen, were taken every 60 seconds using appropriately calibrated equipment.

Stabilisation of groundwater parameters is considered to be achieved when there is less than 10% variation in physiochemical parameters between three successive readings. The groundwater physio-chemical parameters were recorded which included physical observations such as colour and turbidity of the purged water, any indications of the presence of contamination, including odour, sheen, the presence of any foreign material or objects, any quality assurance/quality control (QA/QC) sampling and the unique sample identifier.

Groundwater samples were collected directly from the low-flow pump into appropriately preserved and labelled, laboratory supplied bottles and filled to zero headspace. Samples that required field filtering were collected using an in-line, single-use, 0.45 µm filter.

All samples were stored in an ice chilled cooler during fieldwork and submitted to the laboratory at the conclusion of the field work, with adequate packing to ensure that they arrived intact and at the appropriate temperature to ensure sample preservation.

8. LABORATORY TESTING

8.1. Geotechnical

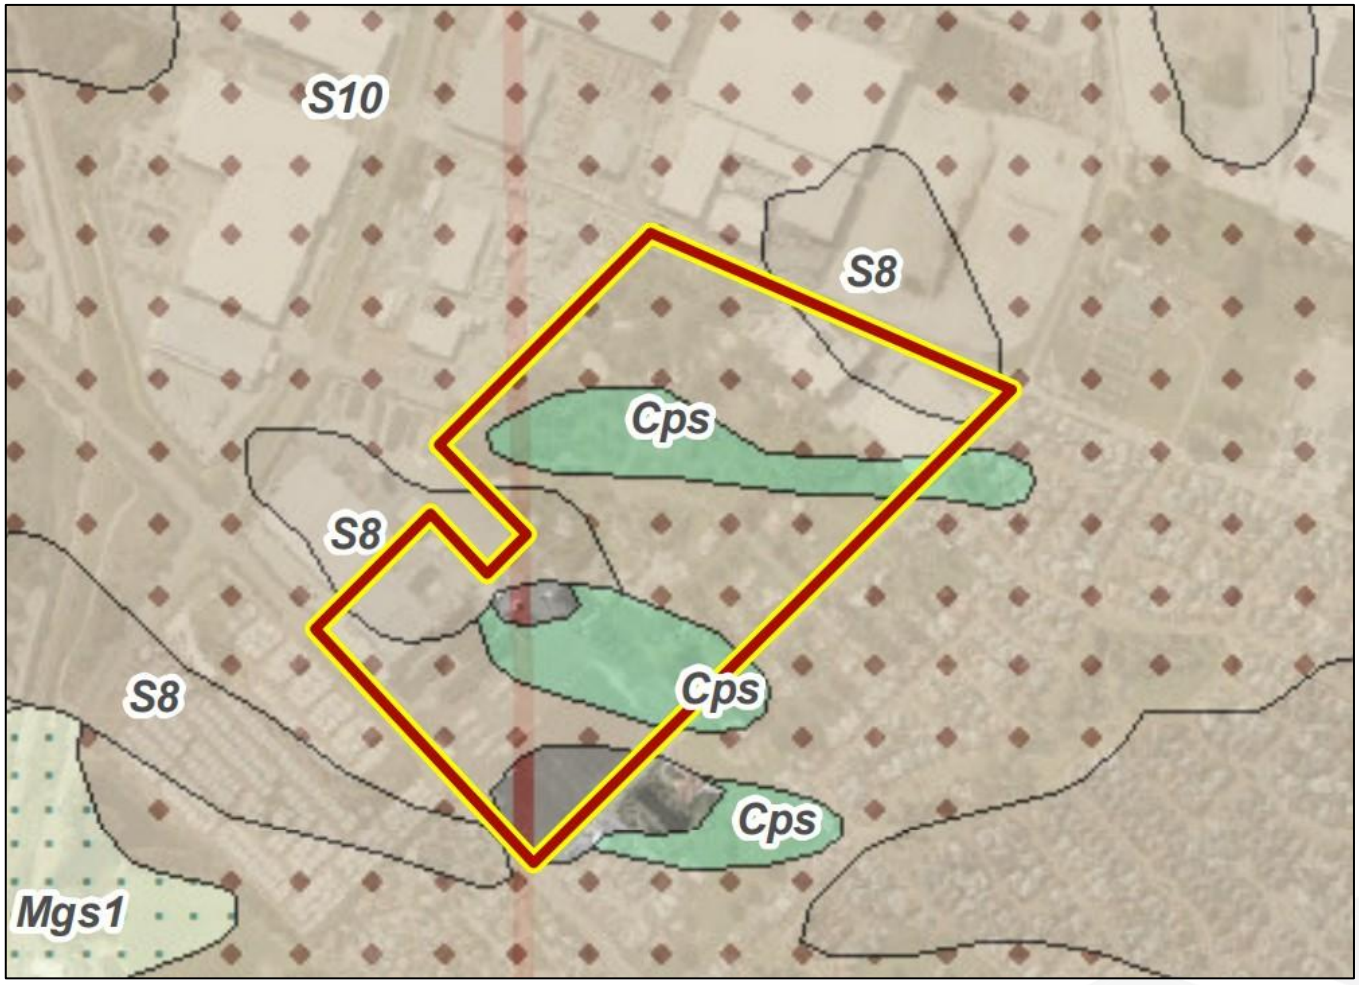
Geotechnical and chemical laboratory testing of soil samples was undertaken by Western Geotechnical and Laboratory Services (WGLS) and Envirolab Services (WA) at their NATA accredited laboratory. Laboratory test results along with the test methods followed are presented in Appendix E and summarised in Attached Tables 1 and 2.

Chemical test results from previous studies are also included in Attached Table 2.

8.2. Environmental

Environmental laboratory testing was conducted by Eurofins laboratory using the chromium reducible sulfur (CRS) method which provides acid base accounting and quantification of potential acid generation. The selection of samples for laboratory analysis was based on soil type and the results of field testing. Groundwater samples were also analysed by Eurofins laboratory for the Department of Water – Groundwater Quality Suite. All laboratory analysis was undertaken using NATA-accredited methods of analysis.

Laboratory certificate of analysis are presented in Appendix F.



9. SITE CONDITIONS

9.1. Geology

Table 6: Summary of Geology Mapping

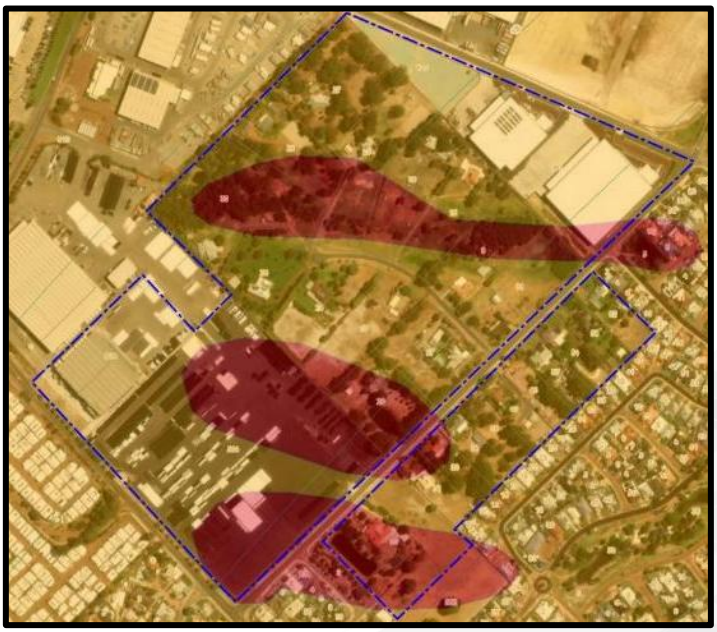
Map Sheet	Map Scale	Mapped Soils
Perth	1:50,000	Refer In-Line Image 3 for distribution of following units: **- Cps**: Peaty CLAY: "*dark grey and black with variable sand content of lacustrine origin [Swamp Deposits (Qhw)]*" **- S8**: Bassendean SAND: "*very light grey at surface, yellow at depth, fine to medium-grained, sub-rounded quartz, moderately well sorted of eolian origin*" **- S10**: "*Thin Bassendean Sand over Guildford formation*"

***NOTE**: Encountered subsurface profile discussed in Section 9.4.*

In-line Image 3: Excerpt from Perth 1:50,000 scale environmental geology map. HCLIA marked in red/yellow.

9.2. Groundwater

Table 7: Summary of Groundwater Levels



Item	Date	Depth Range (m)	Elevation Range (m AHD)	Comment
Perth Groundwater Atlas	2004	-	North: 13 South: 15	Inferred from levels measured in monitoring wells near the end of summer in 2004 only.
	2019		North west: 15.0 to 17.0 South east: 18.5 to 19.5	Inferred from maximum and minimum levels measured in monitoring wells in 2019 only.
DBCA Mapping	-	-	-	Most of the site are mapped as "Sumpland/Dampland", defined as a seasonally inundated/waterlogged area.
Site observations	Aug/Sept 2025	-	Surface to > 3 (Refer Attached Tables 3 to 7)	Groundwater also observed in lakes in southern part of site, and along drainage line in northern part of site. Groundwater could perch on underlying clay / clayey soils at the site.
Recommended Design	-	-	-	Design groundwater levels for the site must be assessed by a suitably qualified civil engineer and / or hydrologist. Subsoil drains and / or table drains could possibly be required.

NOTES: ***1.*** *Perth Groundwater Atlas observations based on monitoring wells which are not located at the site.*

2. *Elevation range for site observations is based on depth and site levels during fieldwork*

9.3. Acid Sulfate Soils

According to the DWER online ASS risk database, the HCLIA and SCP sites are is generally mapped as being within an area of 'moderate to low' ASS risk (highlighted in yellow in In-line Image 4 below) , with part of the site identified as having 'high to moderate' risk (highlighted in red in In-line Image 4 below) within the upper 3 m of the soil profile. High risk areas are judged to be associated with potential organic soils mapped in these areas (refer Section 9.1).

In-line Image 4: ASS Risk Mapping (DWER Database)

9.4. Contamination

The DWER contaminated sites database indicates that the site is not registered as a contaminated site. We note that the public database only shows sites classified as 'Remediated for restricted use', 'Contaminated – restricted use', 'Contaminated – remediation required'.

We understand that the site is likely to be redeveloped for commercial/light industrial purposes and as such, the site is unlikely to be changing to a more sensitive land use.

During fieldwork there were no visual or olfactory indicators of potential contamination. We note that some uncontrolled fill is present in the northern corner of the site. This may require investigation if anthropogenic waste is encountered within the material and/or it is proposed to be reused onsite.

10. GROUND MODEL

The encountered subsurface conditions are summarised in Attached Tables 3 to 7, ad can be generalised as follows:

Most of HCLIA and SCP Sites:

- Surficial Topsoil / Hardstand / Sand Fill Layers; over
- **SAND (SP / SP-SM)**: fine to medium grained, sub angular to sub rounded, typically grey, typically trace fines, typically loose to depths of about 0.5 m to 2.5 m and then becomes typically medium dense, extending to depths of 2.0m to over 6.2 m; with
  - **Interbedded layers of cemented sand / 'Coffee Rock'**: encountered at some locations as cemented layer of sand typically with a higher fines content (i.e. Silty SAND in some zones) about 0.3 m to 1.0 m thick (where penetrated) and below about 2.0 m to 3.4 m depth (refer Attached Tables 3 to 7 for locations encountered). Coffee rock inferred from CPT refusal at some locations. Associated uncemented zones of discoloured brown / black sand with a higher fines content were also encountered in some locations. Layer underlain by sand; over
- **Guildford Formation interbedded CLAY / Clayey SAND / Sandy CLAY / SAND Layers (SP/SC/CL-CH)**: typically stiff to hard cohesive layers and medium dense sand layers, locations of encountered Guildford Formation summarised in Attached Tables 3 to 7.

HCLIA - within / adjacent drainage line and wetland area[1]:

Variable organic soils were encountered as follows:

- **CPT01**: Possible inferred organic soil layer from 0.9 m to 1.2 m depth;
- **BH02**: Trace organics in Clayey SAND from 0.9 m to 2.0 m depth;
- **BH04**: Organic Clayey SAND from 0.7 m to 1.4 m depth
- **BH12/MW01**: PEAT from 0.0 m to 0.6 m depth, and then Organic SAND from 0.6 m to 1.4 m depth.

Notes:

- [1] Drainage line traverses from west to east in northern part of site (refer Figure 1). Wetland area present in western corner of site near Lewis Road. Similar zones of organic soils could be present in lakes at the site (Refer Table 1).
- [2] An area of surficial uncontrolled fill about 1.1 m thick was encountered in the northern corner of site at 27 Hatch Court (refer Galt report referenced: WAG250256-01 001 R Rev1);

11. GEOTECHNICAL ASSESSMENT

The HCLIA and SCP sites are considered geotechnically suitable for redevelopment as industrial land, provided appropriate site preparation is done. Standard site preparation measures for sand sites will apply for most of the site. Geotechnical challenges relevant to the proposed development are summarised as follows:

- **Peat / organic soils** were encountered within / adjacent the drainage line in the northern part of the HCLIA site, and within the wetland area near Lewis Road (refer Figure 1). Similar zones of organic soils could be present in lakes at the site (refer Figure 1 – could also extend to lake in south of SCP). If these areas are to be developed, organic soils will need to be removed from the site. We note that organic soils are likely to be acid sulfate generating, and therefore would require treatments (refer Section 12). Dewatering is also likely to be required to enable remediation of these areas;
- **Cemented sand / 'Coffee Rock'** layers (about 0.3 m to 1.0 m thick) interbedded within the sand were encountered below about 2.0 m to 3.4 m depth (refer Attached Tables 3 to 7). Associated uncemented zones of discoloured brown / black sand with a higher fines content were also encountered in some locations. These materials could have a low permeability, which could impact the performance of soakwells. Coffee rock also has the potential to be acid generating (if removed) and would require treatment (refer Section 12);
- **Areas of shallow groundwater** have been identified in lower lying areas (refer Table 7 and Attached Table 3). Shallow groundwater will impact temporary excavations, and compaction during construction. Dewatering is likely to be required, particularly if construction is undertaken during winter. The potential requirement for and ASSDMP is discussed in Section 12. Shallow groundwater will affect the performance of soakwells and effluent disposal. Control of groundwater levels at the site must be assessed by a suitably qualified civil engineer / hydrogeologist. Subsoil drainage could possibly be required;
- **Surficial uncontrolled fill** about 1.1 m thick was encountered in the northern corner of site at 27 Hatch Court (refer Galt report referenced: WAG250256-01 001 R Rev1). Uncontrolled fill must be removed, assessed by a suitably qualified engineer and environmental scientist (refer Section 12), and either removed from site, or (if suitable) reused as approved fill; and
- **Environmental considerations** are discussed in Section 12.

Geotechnical recommendations for the site are summarised in the Table 8.

Table 8: Summary of Geotechnical Assessment

Type	Clause	Parameter	Comment
Site Suitability	-	-	We consider both sites to be geotechnically suitable for the proposed development with appropriate site preparation measures. Standard site preparation measures will apply for most of the site (refer further comments above table).
Site Classification (AS2870)	GDR5	A / P	Class A for most of each site. Class P in drainage lines, wetland areas and lakes (refer Table 1). The site classification in these areas could be improved if organics soils are removed and replaced.
Site Subsoil Class (AS1170.4)	-	Ce	-
Site Preparation	GDR6	-	**For most of the site**: preparation will comprise **GDR6.2.1 Common Measures** followed by **GDR6.2.2 Sand Sites.** Surficial uncontrolled fill in the northern part of the site must be remediated (refer Galt report referenced: WAG250256-01 001 R Rev1). We anticipate raising of the site above shallow groundwater levels by importation and compaction of sand fill (**Permeable Sand**), however this is subject to civil design. **In drainage lines, wetland areas and lakes (refer Table 1):** If these areas are to be developed, organic soils present in these areas (refer Section 9.4) will need to be removed and replaced with approved fill. Dewatering and treatment of water / soil for acid sulfates will also be required (refer Section 12).

Type	Clause	Parameter	Comment
Footing Preparation and Testing	GDR6.4	-	We expect the base of footings at this site to be entirely within sand. We refer you to GDR6.4.1. A PSP may be used to verify compaction in footing excavations as discussed below.
Topsoil Strip	GDR6.2.1	Thickness = 100 mm	Expected thickness of topsoil strip (average).
Compaction Control	GDR7	-	Requirements for "Sand" as per GDR7 Compaction control at this site may be done using a Perth sand penetrometer (PSP). The target blow counts for "Bassendean Sand" are applicable as per **GDR7.4 Perth Sand Penetrometer.**
Approved Fill	GDR8	Permeable Sand or General Sand	Approved fill at this site is to comprise **Permeable Sand** (where stormwater disposal is required) or **General Sand** (where stormwater disposal is not required) as per **GDR8 Approved Fill and Conformance Testing.** The insitu sand is suitable for reuse as **General Sand**, and as likely to have an unsaturated hydraulic conductivity of approximately 3 m/day when compacted. **Further permeability testing of recompacted insitu sand is required to derive a design hydraulic conductivity value.**
Excavations, batters and slopes	GDR12	1V:2H (temporary) 1V:3H (permanent)	Excavations in sand should be readily achievable to 2 m with 15 ton excavator or similar. The batter angles given are for slopes up to 2 m high and above groundwater. Refer to **GDR12 Excavations, Batters and Slopes** for more information. **Dewatering will be required for excavations in lower lying areas of shallow groundwater.**
Unsaturated Hydraulic Conductivity	GDR13	k_{unsat} = 3 m/day for isolated soakwells, and k_{unsat} = 5 m/day for interconnected soakwells.	k_{unsat} values apply where disposing into natural grey sand, minimum 0.5 m above the groundwater table, coffee rock layers (or overlying perched water) or black / brown sand layers near the groundwater table as per GDR13.4.
Pavement Subgrades	GDR16	CBR = 10%	For subgrades of granular pavements comprising compacted approved fill / insitu sand.
Acid Sulfate Soils	-	Refer Section 12	Management of acid sulfate soils is likely to be required during construction.

NOTES: ***1.*** *q_{all} – allowable bearing pressure (maximum for all footings, refer to footing tables for further details)*

12. PRELIMINARY ENVIRONMENTAL ASSESSMENT

12.1. Soil

The field-testing results are summarised in Table 9 below and presented in Appendix G. Laboratory certificates of analysis are presented in Appendix H

Table 9: Summary of Soil Field Results

Field pHf range	Field pHfox range	pH change	Laboratory pH range	Maximum Net Acidity (%S)
4.7 – 8.5	2.6 – 6.5	1.0 – 5.8	4.0 – 9.5	<0.02 – 0.14

Laboratory analytical results indicate that the net acidity in all samples, except BH16/3.0 (0.14%S) were below the laboratory limit of reporting (LOR) and/or below the maximum net acidity of 0.03%S.

Tabulated results are presented in Appendix G.

12.2. Groundwater

Groundwater at the site was encountered at depths ranging from 0.28 to 1.15 m below ground level with a pH ranging from 6.18 – 7.16. Mildly elevated inherent acidity along with high to very high alkalinity concentrations were noted at

both monitoring locations indicating that groundwater will likely have sufficient self-buffering capacity to maintain an acceptable pH in the event of ASS generation.

Elevated concentrations of aluminium and iron indicate that historical oxidation of ASS may have occurred at the site. Concentrations of chloride were found to exceed non-potable use of groundwater guidelines in MW01 (330 mg/L).

Groundwater field parameters are presented in Appendix H and tabulated groundwater results are presented in Appendix I.

12.3. Summary

Based on the findings of the study and previous experience with ASS identification, coffee rock and organic soils at the site are considered to be ASS.

13. RECOMMENDATIONS

We recommend a more detailed investigation of ASS is conducted in the event that deep disturbances and/or dewatering are required as part of future development at the site. The need for this will mainly depend on the filling regime and disturbances in the drainage lines and lakes present at the site.

14. CLOSURE

DEFINITIONS

q_t : Cone tip resistance corrected for pore water pressure
S_t : Sensitivity
e : Void ratio
D_r : Relative density
OCR : Overconsolidation ratio
OC : Overconsolidated

SOIL BEHAVIOUR TYPE ZONES

1. Sensitive fine grained
2. Organic material
3. Clay
4. Silty clay to clay
5. Clayey silt to silty clay
6. Sandy silt to clayey silt
7. Silty sand to sandy silt
8. Sand to silty sand
9. Sand
10. Gravelly sand to sand
11. Very stiff fine grained material (OC/cemented)
12. Sand to clayey sand (OC/cemented)

NOTES

A. Some overlap in type zones is expected
B. Local correlations are preferred and may indicate soil type boundaries that are different from those shown above

Appendix C: Borehole Logs

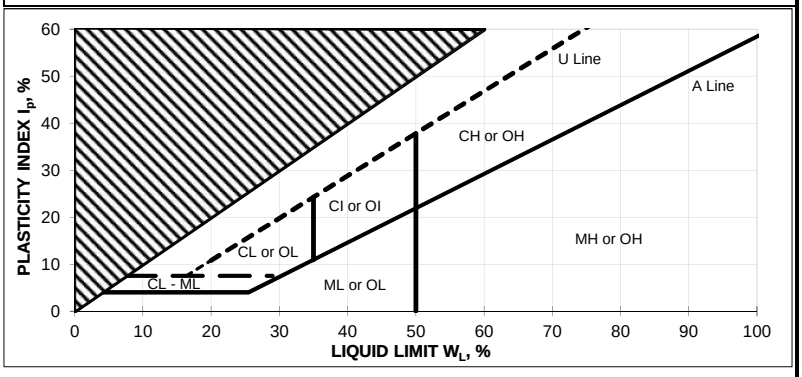
METHOD OF SOIL DESCRIPTION
BOREHOLE AND TEST PIT REPORTS

GRAPHIC LOG & SOIL CLASSIFICATION SYMBOLS

Graphic	USCS	Soil Name
		FILL (various types)
		COBBLES / BOULDERS
	GP	GRAVEL (poorly graded)
	GW	GRAVEL (well graded)
	GC	Clayey GRAVEL
	GM	Silty GRAVEL
	SP	SAND (poorly graded)
	SW	SAND (well graded)
	SC	Clayey SAND

Graphic	USCS	Soil Name
	SM	Silty SAND
	ML	SILT (low liquid limit)
	MH	SILT (high liquid limit)
	CL	CLAY (low plasticity)
	CI	CLAY (medium plasticity)
	CH	CLAY (high plasticity)
	OL	Organic SILT (low liquid limit)
	OH	Organic SILT (high liquid limit)
	Pt	PEAT

NOTE: Dual classification given for soils with a fines content between 5% and 12%.



SOIL CLASSIFICATION AND INFERRED STRATIGRAPHY

Soil descriptions are based on AS1726-2017. Material properties are assessed in the field by visual/tactile methods in combination with field and laboratory testing techniques (where used).

NOTE: AS 1726-2017 defines a fine grained soil where the total dry mass of fine fractions (<0.075 mm particle size) exceeds 35%.

PARTICLE SIZE		
Soil Name		**Particle Size (mm)**
BOULDERS		>200
COBBLES		63 to 200
GRAVEL	Coarse	19 to 63
	Medium	6.7 to 19
	Fine	2.3 to 6.7
SAND	Coarse	0.6 to 2.36
	Medium	0.21 to 0.6
	Fine	0.075 to 0.21
FINES	SILT	0.002 to 0.075
	CLAY	<0.002

PLASTICITY - MODIFIED CASAGRANDE CHART - AS1726-2017

RESISTANCE TO EXCAVATION		
Symbol	**Term**	**Description**
VE	Very easy	All resistances are relative to the selected method of excavation
E	Easy	
F	Firm	
H	Hard	
VH	Very hard	

MOISTURE CONDITION	
Symbol	**Term**
D	Dry
M	Moist
W	Wet

CEMENTATION	
Cementation	**Description**
Weakly cemented	Soil may be easily disaggregated by hand in air or water
Moderately cemented	Effort is required to disaggregate the soil by hand in air or water

CONSISTENCY		
Symbol	**Term**	**Undrained Shear Strength (kPa)**
VS	Very Soft	0 to 12
S	Soft	12 to 25
F	Firm	25 to 50
St	Stiff	50 to 100
VSt	Very Stiff	100 to 200
H	Hard	>200

ORGANIC SOILS	
Material	**Organic Content % of dry mass**
Inorganic soil	<2%
Organic soil	2% to 25%
Peat	>25%

DENSITY		
Symbol	**Term**	**Density Index (%)**
VL	Very Loose	<15
L	Loose	15 to 35
MD	Medium Dense	35 to 65
D	Dense	65 to 85
VD	Very Dense	>85

EXPLANATORY NOTES TO BE READ WITH BOREHOLE AND TEST PIT REPORTS

METHOD OF DRILLING OR EXCAVATION

AC	Air Core	E	Excavator	PQ3	PQ3 Core Barrel
AD/T	Auger Drilling with TC-Bit	EH	Excavator with Hammer	PT	Push Tube
AD/V	Auger Drilling with V-Bit	HA	Hand Auger	R	Ripper
AT	Air Track	HE	Hand Excavation	RR	Rock Roller
B	Bulldozer Blade	HQ3	HQ3 Core Barrel	SON	Sonic Rig
BH	Backhoe Bucket	N	Natural Exposure	SPT	Driven SPT
CT	Cable Tool	NMLC	NMLC Core Barrel	WB	Washbore
DT	Diatube	PP	Push Probe	X	Existing Excavation

SUPPORT

T	Timbering

PENETRATION EFFORT (RELATIVE TO THE EQUIPMENT USED)

VE	Very Easy	E	Easy	F	Firm
H	Hard	VH	Very Hard		

WATER

►	Water Inflow	▼	Water Level
◄	Water Loss (complete)		
◁	Water Loss (partial)		

SAMPLING AND TESTING

B	Bulk Disturbed Sample	P	Piston Sample
BLK	Block Sample	PBT	Plate Bearing Test
C	Core Sample	U	Undisturbed Push-in Sample
CBR	CBR Mould Sample		U50: 50 mm diameter
D	Small Disturbed Sample	SPT	Standard Penetration Test
ES	Environmental Soil Sample		Example: 3, 4, 5 N=9
EW	Environmental Water Sample		3,4,5: Blows per 150 mm
G	Gas Sample		N=9: Blows per 300 mm after
HP	Hand Penetrometer		150 mm seating interval
LB	Large Bulk Disturbed Sample	VS	Vane Shear; P = Peak
M	Mazier Type Sample		R = Remoulded (kPa)
MC	Moisture Content Sample	W	Water Sample

ROCK CORE RECOVERY

TCR = Total Core Recovery (%) $= \frac{CRL}{TCL} \times 100$

RQD = Rock Quality Designation (%) $= \frac{ALC>100}{TCL} \times 100$

TCL	Length of Core Run
CRL	Length of Core Recovered
ALC>100	Total Length of Axial Lengths of Core Greater than 100 mm Long

Phosphorus Retention Index	-		21	200	4.0	0.50	1.5

Method Summary

Method ID	Methodology Summary
AGRI-003_PRI	Phosphorous Retention index (PRI) is the ratio of adsorbed phosphorus to the equilibrium concentration. Phosphorus is extracted using KCl and determined colourimetrically. Result value is used to calculate PRI as per Allen and Jefferey.
INORG-001	pH - Measured using pH meter and electrode. Please note that the results for water analyses are indicative only, as analysis can be completed outside of the recommended holding times. Solids are reported from a 1:5 water extract unless otherwise specified. Alternatively, pH is determined in a 1:5 extract using 0.01M calcium chloride or a solid is extracted at a ratio of 1:2.5 (AS1289.4.3.1), pH is measured in the extract.
INORG-002	Conductivity and Salinity - measured using a conductivity cell at 25°C. Soil results reported from a 1:5 Soil:Water extract unless otherwise specified. Please note Resistivity is estimated by calculation and may not correlate with results otherwise obtained using the Resistivity current method (based on AS 1289.4.4.1), depending on the nature of the soil being analysed. Blanks may yield EC readings >1µS/cm, this is likely due to adsorption of Carbon Dioxide while the blank sample is sat on the instrument autosampler prior to analysis. The values are generally insignificant (<5µS/cm) compared to most actual sample conductivities.

Result Definitions

Identifier	Description
NR	Not reported
NEPM	National Environment Protection Measure
NS	Not specified
LCS	Laboratory Control Sample
RPD	Relative Percent Difference
>	Greater than
<	Less than
PQL	Practical Quantitation Limit
INS	Insufficient sample for this test
NA	Test not required
NT	Not tested
DOL	Samples rejected due to particulate overload (air filters only)
RFD	Samples rejected due to filter damage (air filters only)
RUD	Samples rejected due to uneven deposition (air filters only)
##	Indicates a laboratory acceptance criteria outlier, for further details, see Result Comments and/or QC Comments

Quality Control Definitions

Blank

This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, and is determined by processing solvents and reagents in exactly the same manner as for samples.

Surrogate Spike

Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

LCS (Laboratory Control Sample)

This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.

Matrix Spike

A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.

Duplicate

This is the complete duplicate analysis of a sample from the process batch. The sample selected should be one where the analyte concentration is easily measurable.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria. Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction. Spikes for Physical and Aggregate Tests are not applicable. For VOCs in water samples, three vials are required for duplicate or spike analysis.

General Acceptance Criteria (GAC) - Analyte specific criteria applies for some analytes and is reflected in QC recovery tables.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% - see ELN-P05 QAQC tables for details (available on request); <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase. Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was typically insufficient in order to satisfy laboratory QA/QC protocols.

Miscellaneous Information

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached. We have taken the sampling date as being the date received at the laboratory.

Two significant figures are reported for the majority of tests and with a high degree of confidence, for results <10*PQL, the second significant figure may be in doubt i.e. has a relatively high degree of uncertainty and is provided for information only.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, Total Recoverable metals and PFAS where sediment/solids are included by default.

Urine Analysis - The BEI values listed are taken from the 2022 edition of *TLVs and BEIs Threshold Limits by ACGIH*.

Air volumes are typically provided by customers (often as flow rate(s) and sampling time(s) and/or simply volume(s) sampled or exposure times (determines 'volume' passive badges are exposed to)). Hence in such circumstances the volume measurement is inevitably not covered by Envirolab's NATA accreditation. An exception may occur where Envirolab Newcastle does the sampling where accreditation exists for certain types of sampling and hence volume determination(s). Note air volumes are often used to determine concentrations for dust and/or analyses on filters, sorbents and in impingers. For canister sampling, the air volume is covered by Envirolab's NATA accreditation.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from the latest "Australian Drinking Water Guidelines", published by NHMRC. No guideline values have been set for Total Coliforms in drinking water. Increased concentrations should be investigated. Total Coliforms are not considered useful as indicators of the presence of faecal contamination.

Where we have provided guideline values eg. ADWG Health Value, it is the responsiblity of the reader to decide if the water is fit for consumption. Please note that the tests we have conducted are just a selection of common tests to give you a general idea of drinking water quality. There are many other tests included in the ADWG that we have not tested for.

Data Quality Assessment Summary PGI0989

Client Details

Client	Western Geotechnical & Laboratory Services
Your Reference	S18630 / Proposed HCLIA
Date Issued	19/09/2025

Recommended Holding Time Compliance

No recommended holding time exceedances

Quality Control and QC Frequency

QC Type	Compliant	Details
Blank	Yes	No Outliers
LCS	Yes	No Outliers
Duplicates	Yes	No Outliers
Matrix Spike	Yes	No Outliers
Surrogates / Extracted Internal Standards	Yes	No Outliers
QC Frequency	Yes	No Outliers

Surrogates/Extracted Internal Standards, Duplicates and/or Matrix Spikes are not always relevant/applicable to certain analyses and matrices. Therefore, said QC measures are deemed compliant in these situations by default. See Laboratory Acceptance Criteria for more information

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	N/A
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
S01	Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime (CaCO3) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m3 in-situ soil' multiply 'reported results' x 'wet bulk density of soil in t/m3'
S02	Retained Acidity is Reported when the pHKCl is less than pH 4.5
S03	Acid Neutralising Capacity is only required if the pHKCl if greater than or equal to pH 6.5
S04	Acid Sulfate Soil Samples have a 24 hour holding time unless frozen or dried within that period

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acidity (as CaCO3)	Welshpool	Sep 15, 2025	14 Days
- Method: LTM-INO-4210 Acidity			
Ammonia (as N)	Welshpool	Sep 15, 2025	28 Days
- Method: ARL303 - Ammonia in Water by Discrete Analyser			
Chloride	Welshpool	Sep 15, 2025	28 Days

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

WA DWER, November 2021, WA DWER Non-potable groundwater use guideline (NPUG) (2021)

Standard Geotechnical Definitions, Recommendations, Requirements and Limitations

GDR1 ABOUT THIS APPENDIX

These technical notes are to be read with the attached report. These notes contain important information regarding the study in the attached report, and the report cannot be considered in isolation without full reading of these notes.

Where there are conflicts between this appendix and the report text, the report text takes precedence.

Unless noted otherwise, geotechnical investigations are conducted in accordance with AS1726-2017, “Geotechnical site investigations”.

Unless noted otherwise, the report does not include any assessment (or implied assessment) of karst risk.

GDR2 DEFINITIONS

The following definitions apply:

- **Approved Fill** – fill that has been assessed and approved by the geotechnical engineer or civil designer for a particular purpose.
- **Bedding** – A controlled fill layer placed beneath buried elements such as pipes, cables or other infrastructure to provide uniform support and distribute loading.
- **Bulk Fill** – Controlled fill intended to support future infrastructure, but potentially lacking some engineering properties required for upper fill layers or adjacent to structures, where fill with specific properties may be required. Contrast with Select Fill.
- **Civil Design** – the engineering design of the earthworks including surface water and erosion control and subsurface drainage control (where required) to achieve an earthworked, drained site which is capable of supporting the proposed development (including target site classification to AS2870, where relevant). This design is separate to this geotechnical investigation and is a required element of a site development.
- **Clay** – A component of a soil with particles smaller than 0.002 mm in size.
- **Cohesionless (Non-cohesive) Soil** – A soil mass that has does not hold together at low applied stress levels. The strength of the soil depends solely on friction between particles.
- **Cohesive Soil** – A soil mass that has holds together and can adhere to itself.
- **Collapsible Soil** – a soil with high void ratio that is typically strong when dry but loses strength and consolidates under constant stress when wetted, usually due to loss of soil matric suction or dissolving of a chemical cementing agent.
- **Compaction –** The process of increasing the soil density, typically be mechanical means.
- **Competent Person** – A person who has, through a combination of training, education and experience, acquired knowledge and skills enabling that person to correctly perform a specified task.
- **Consistency** – The stiffness of a cohesive soil, at specific moisture contents, to resist mechanical stress or manipulation (remoulding).
- **Controlled (or engineered) Fill** – Any fill for which engineering properties are controlled during placement. Also referred to as structural fill.
- **Dense –** with respect to sandy soils, at a relatively high density index or dry density ratio, exhibiting better engineering parameters with respect to strength and stiffness than the same material at a lower density index.
- **Density** – A measure of the mass of material per unit volume.
- **Eccentric Load** – a load incorporating either a varying vertical load and/or a horizontal load such that the peak vertical stress exceeds the average vertical stress.
- **Embedment Fill** – A controlled fill material placed around and above buried infrastructure (such as pipes, cables or conduits) to provide protection and support.
- **Fill** – Any material that has been placed by anthropogenic processes.
- **Fines** – A component of a soil with particles smaller than 0.075 mm in size.
- **Groundwater** – Water located beneath the earth’s surface in pore spaces, fractures and voids in soil or rock.

- **Gravel** – A component of a soil with particles between 2.36 mm and 63 mm in size.
- **Heavily Loaded** – in reference to mobile plant, particularly intended for equipment where ground bearing pressures exceed 50 kPa and/or equipment has a high centre of gravity and could be prone to toppling. In reference to buildings/structures, where footing pressures exceed 100 kPa and/or footing dimensions exceed 1 m wide.
- **Hydraulic Conductivity** – ratio of volume flux to hydraulic gradient – a quantitative measure of soil's ability to transmit water when subjected to a hydraulic gradient. k_{sat} – saturated hydraulic conductivity, intended for dewatering assessment, subsoil drainage design and other engineering assessments where saturated soils are relevant. k_{unsat} – unsaturated hydraulic conductivity, intended for design of stormwater disposal elements such as soakwells and infiltration basins, where the base of disposal elements is above the groundwater level.
- **In situ** – In the place and condition in which it exists naturally. May also refer to fill that is present at any site prior to an investigation taking place.
- **Limestone** – A sedimentary carbonate rock. The use of the term does not infer a specific strength, carbonate content or grain size. Refer to GDR4.1 for further detail.
- **Loose** – with respect to sand soils, at a relatively low density index or dry density ratio, typically indicating poorer engineering parameters with respect to strength and stiffness than the same material at a higher density index.
- **Material** – Matter that meets the definitions of 'soil', 'rock', other engineered matter (i.e., concrete, bricks etc.) or non-engineered matter (organics, contaminated refuse, deleterious material).
- **May** – Indicates that the statement is an option.
- **Must** – Indicates that the statement is mandatory.
- **Natural** – In the context of soil or rock, material which is present as a result of natural geological processes and has not been subject to anthropogenic engineering processes (such as filling, excavation, replacement, etc).
- **Organic** – In the context of soil, material derived from living matter, primarily plants.
- **Overconsolidated** – a soil that has been subjected to a greater vertical stress than its current state.
- **Permeable Soil** – soil that meets the civil design permeability requirements to allow relatively rapid flow of water through the soil matrix.
- **Rock** – Any aggregate of minerals and/or materials that cannot be disaggregated by hand in air or water without prior soaking.
- **Sand** – a component of soil with particle size between 0.075 mm and 2.36 mm.
- **Select Fill** – a controlled fill which has been chosen for particular engineering characteristics (such as strength, CBR, grading, permeability, etc), commonly for use as a higher-grade capping layer or adjacent to structures. Contrast with Bulk Fill.
- **Shall** – Indicates that the statement is mandatory.
- **Should** – Indicates that the statement is a recommendation.
- **Silt** – A component of a soil with particles between 0.075 mm and 0.002 mm in size.
- **Soil** – Particulate materials that occur in the ground and can be disaggregated or remoulded by hand in air or water without prior soaking.
- **Sand** – A component of a soil with particle between 0.075 mm and 2.36 mm in size.
- **Uncontrolled Fill** – Any material that has been deposited by anthropogenic process, which does not meet the definition of 'controlled fill'.

GDR3 GEOTECHNICAL TEST METHODS AND INTERPRETATION

GDR3.1 Test Pit Excavation

Test pit excavations are formed using mechanical excavation equipment (typically an excavator) or hand dug, with the objective of inspecting (or profiling) the soil exposed in the excavation.

Typical limitations on test pit excavations are:

- Limited depth of excavation – typically governed by reach of the excavator arm.
- Cannot be excavated below groundwater in cohesionless soils, due to collapse and water ingress.
- Cannot be excavated through very stiff / very dense soils (i.e., desiccated clays or cemented soils) or most rock.
- Cannot typically obtain rock samples that are suitable for strength testing.

Test pits are usually mechanically excavated with a toothed bucket (intended for excavation in clay or weak rock) or a flat-edged bucket (typically for sands).

When hand-dug test pits are excavated, it is usually for recovery of near-surface soils or inspection of shallow in-ground elements.

We note that where test pits are excavated on a site, they are only ever loosely backfilled during our studies. They must always be located during site preparation works, over-excavated to their full depth and plan extents and re-filled with approved fill in compacted layers.

GDR3.2 Cone Penetration Tests (CPTs)

Cone penetration testing (CPT) is done by Galt or specialist contractors and typically to AS1289.6.5.1. The test involves pushing an instrumented cone into the soil with a hydraulically operated pushing frame. The test measures tip resistance and sleeve friction on the cone, which are then plotted with depth.

We interpret soil types and associated geotechnical soil parameters from CPT data using the following:

GDR3.3 Borehole Drilling

Boreholes are drilled for sampling of the soil and rock, with a small disturbance footprint. Typical techniques are:

- Auger drilling (hand auger or machine auger) – for recovery of soil at relatively shallow depths only. Cannot penetrate cemented soils or rock.
- Push probe drilling – for recovery of soil at relatively shallow depths and below groundwater. Cannot penetrate cemented soils or rock.

- Air core drilling – for recovery of soil, cemented soil and rock (typically up to high strength rock). Not suited to drilling of very high strength rock.
- Diamond coring (or rotary coring) – for recovery of cemented soil, rock and some soil types (typically not sand). Suited to all strengths of rock.

If used, standard penetration tests (SPTs) are done in accordance with AS1289.6.3.1. Correlations for consistency and density are based on:

- Standards Australia (2016), "HB160-2006, Soils Testing".

GDR3.4 Dynamic Cone Penetrometer (DCP)

The DCP is a hand-held tool for assessing penetration resistance of a soil. This comprises a 16 mm rod equipped with a 20 mm cone, hammered into the ground using a falling 9 kg weight on a 510 mm slide hammer on the top of the rod. This is done in accordance with AS1289.6.3.2 and the blow counts to hammer in the rod are measured in 100 mm penetration increments. Where provided, correlations for consistency and density are based on:

- Standards Australia (2016), "HB160-2006, Soils Testing".

GDR3.5 Perth Sand Penetrometer (PSP)

The PSP is a variation on a DCP and uses a 9 kg weight on a 600 mm slide hammer to hammer in a 16 mm rod with a blunt (square-faced) end. Testing is done in accordance with AS1289.6.3.3, with the following typical variations:

- Testing is often done to a greater depth than the 450 mm covered in the standard.
- Blow counts are sometimes recorded in 150 mm intervals (compared to 300 mm intervals used in the standard) to provide better resolution on the tests.

Where provided, correlations for density are based on:

- Standards Australia (2016), "HB160-2006, Soils Testing".

GDR3.6 Dynamic Probing Super Heavy (DPSH)

The DPSH test involves driving a solid cone (20 cm^2) into the ground using a 63.5 kg hammer falling 760 mm. Testing is done in accordance with EN ISO 22476-2 – Geotechnical engineering – Field testing – Part 2: Dynamic probing – DPSH-B.

Results may be presented as either:

- N10 (No. of blows required for every 100 mm penetration);
- N30 (No. of blows required for every 300 mm penetration); or
- q_d (dynamic tip resistance, analogous to CPT q_c).

GDR3.7 Inverse Auger Hole Infiltration Test (Falling Head, Unsaturated Soil)

Infiltration tests are carried out using the 'inverse auger hole' method described by:

- Cocks, G (2007), "Disposal of Stormwater Runoff by Soakage in Perth Western Australia", Journal and News of the Australian Geomechanics Society, Volume 42 No. 3, pp 101-114

This test is an unsaturated falling head test, in that it is carried out above the groundwater table and is intended to mimic the behaviour of soak wells and similar drainage elements (i.e. soakage basins), which discharge stormwater into an unsaturated medium.

The hole is wetted only for a short period prior to the testing.

The test is usually repeated three times, with the intention that the second and third tests provide similar results (within about 10%-20%). Tests are done over a short duration, typically 2 minutes to 10 minutes. The focus of the testing is generally when the head is low (200 mm or lower), such that the relevant lateral zone is as saturated as the zone directly below the borehole.

The hydraulic conductivity derived from this test is not to be used for applications where saturated hydraulic conductivity is relevant, e.g.:

- Subsoil drainage design; and

- Dewatering estimations.

Based on Galt's in-house research, this method does not completely saturate the soil in any reasonable test length, and thus may not be suitable for assessment of soils at sites where the critical drainage condition is a fully saturated soil (i.e., in areas with high groundwater tables). Our research on sand sites indicates that the test does correlate well with actual soak well performance, in unsaturated sand zones without impermeable zones.

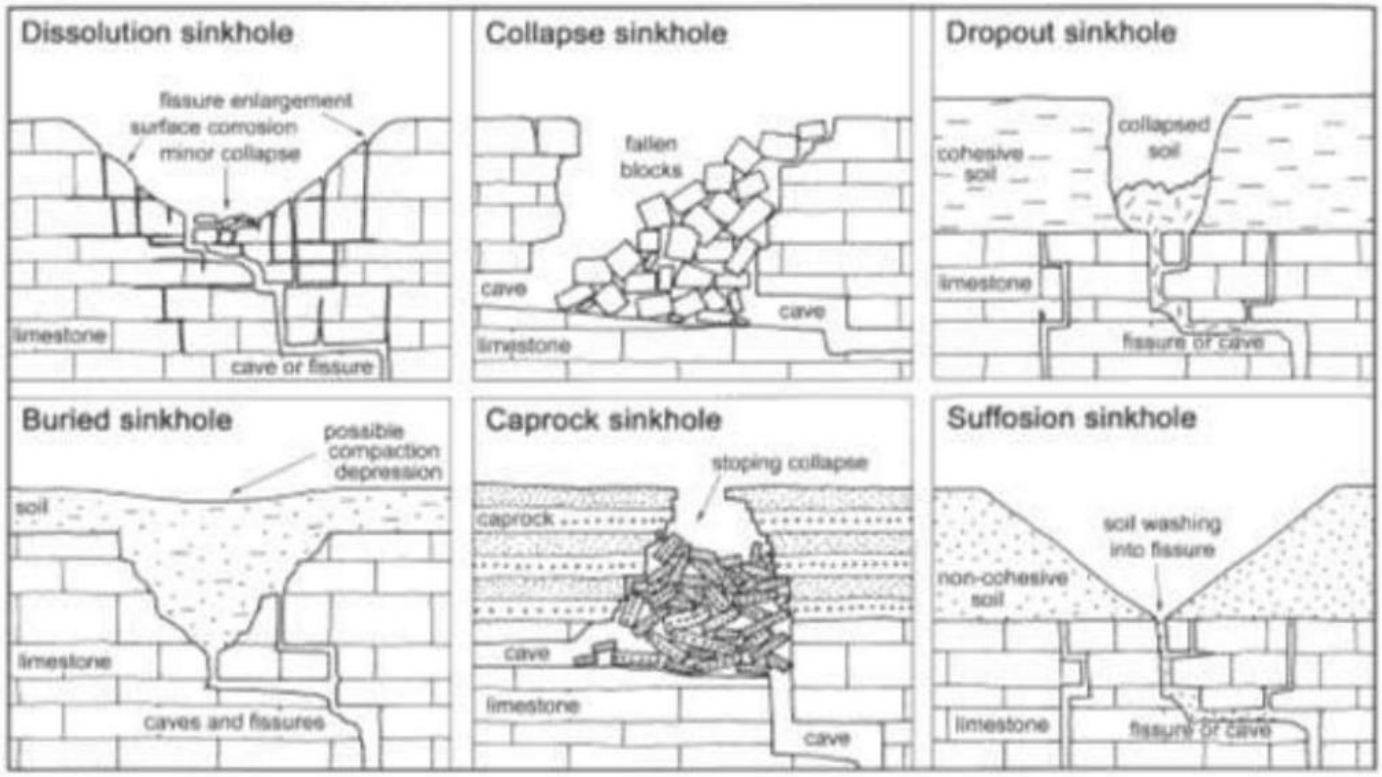
GDR3.8 Guelph Permeameter Test (Constant Head, Quasi-Saturated Soil)

The Guelph permeameter test, conducted in accordance with the constant head test method outlined in Appendix G of AS1547, is a constant-head test in nominally "saturated" soil (in that the test is conducted until a "steady state" is reached). However, we note that this test can only be done above the groundwater table and as such, is in an unsaturated zone. Therefore, the hydraulic conductivity derived from this test should be used with caution and evaluated against other test methods (such as saturated, constant-head permeability testing from laboratory samples, or in situ saturated hydraulic conductivity testing below the groundwater table).

GDR4 GEOLOGICAL UNITS

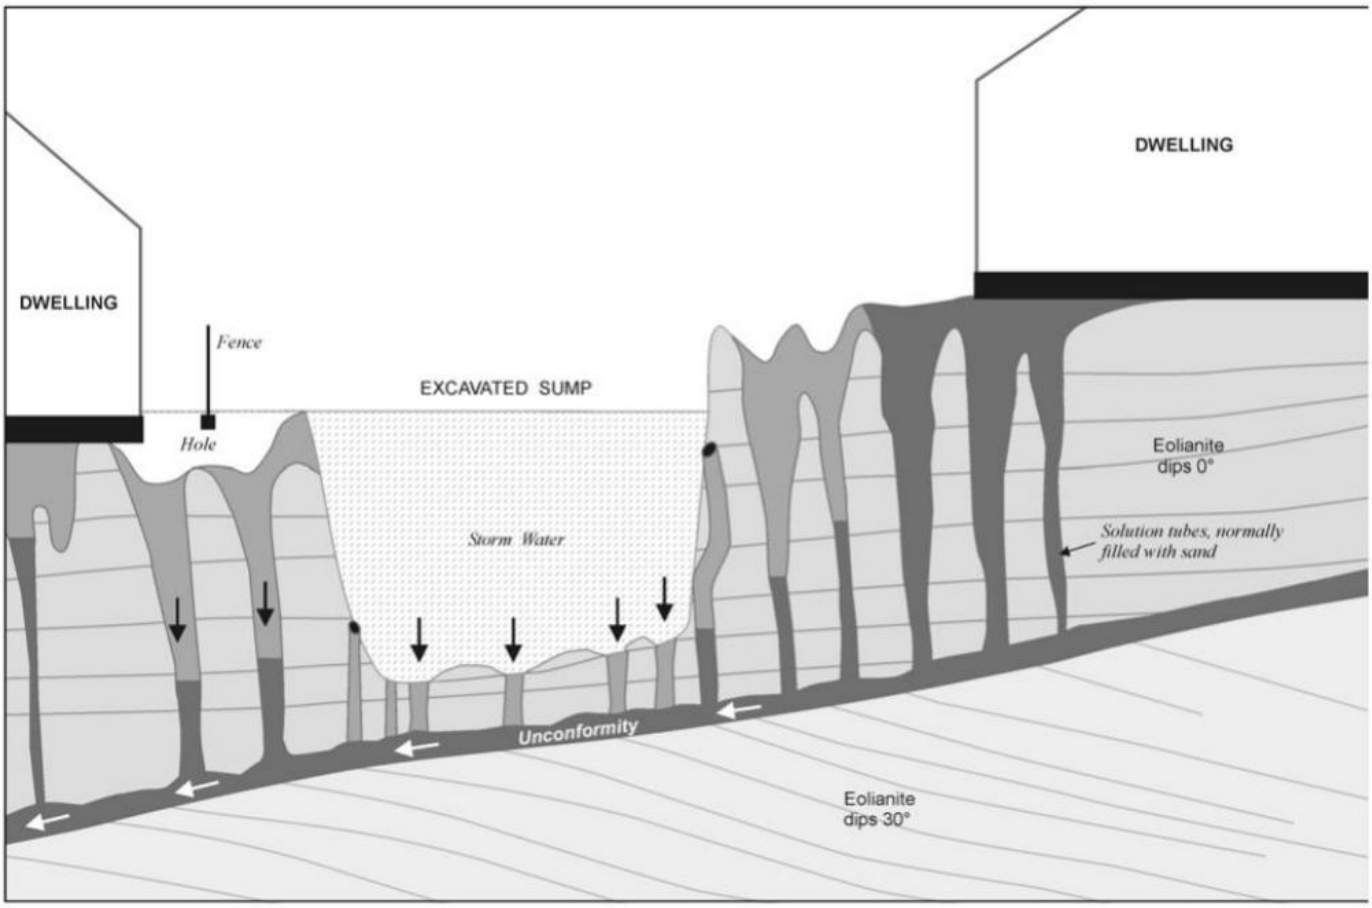
GDR4.1 Limestone

The term 'Limestone' is used to describe a carbonate rock. Tamala Limestone is the common limestone in Western Australia, and typically comprises cemented quartz and shell fragments cemented together by calcium carbonate.



Limestone can vary significantly across short distances in composition, strength and cementation. Tamala limestones in Western Australia also have known possible geological features including:

- Caprock/calcrete – The formation of a very hard duricrust, usually due to sun exposure. Caprock may be up to 3 m thick, but typically around 1.5 m thick. Caprock is very difficult to excavate and may require the use of hydraulic rock breakers or rock saws to excavate.
- Solution features/tubes – Often initially formed due to the presence of Eucalypt and Jarrah roots during limestone formation, and often increasing in depth and size due to ongoing weathering. May be up to 500 mm in diameter. These are typically filled with very loose, unconsolidated sand.
- Pinnacles – Pinnacles are usually the limestone that is left around surrounding solution features. Often can comprise very hard limestone/caprock that can be substantially higher than surrounding areas. Pinnacles may have also been formed by surrounding erosion (i.e., wind/water).
- Karst/caves – Karst is caused by the dissolution of limestone, typically where there is interaction in low-lying areas with water and limestone. Karst manifests itself as loose near-surface sand with cavities (caves) in the underlying limestone. This can lead to sinkholes and collapse of overlying structures.



Inline images showing typical pinnacle/solution features and Karstic features follow. These are taken from:

- Gordon, R. (2003). "Coastal Limestones". Australian Geomechanics Vol.38 No. 4, The Engineering Geology of Perth.
- Waltham, A. & Fookes, P. (2003). "Engineering Classification of Karst Ground Conditions: Quarterly Journal of Engineering Geology and Hydrogeology, Vol 36.

Inline Image GDR 1 - Karstic Sinkhole Features from Waltham and Fookes (2003)

Inline Image GDR 2: Pinnacle/Solution Features from Gordon (2003)

GDR4.2 Pindan Sands and Collapsible Soils

In the Western Australian context, Pindan sands are sandy soils present predominantly across the Pilbara and Kimberley regions. Pindan sands are typically:

- Red brown in colour.
- Between 10% and 40% fines.
- Of aeolian origin, usually resulting in unconsolidated in situ conditions (nuclear density gauge testing often indicates these soils have in situ density ratios of 80%-85% of modified maximum dry density).
- Very strong when dry due to high soil suctions in the fine fraction, which create strong bonds between the sand particles.

As the grains are usually held in place by the dry fine fraction, this can lead to:

- very high settlements (i.e., “collapse”) as the grain-to-grain bonds are weakened as matric suction decreases on soaking; and
- loss of vertical and horizontal strength/stiffness as the grain-to-grain bonds weaken.

The risks associate with Pindan sands are usually quantified in terms of the collapse potential/magnitude of possible collapse events.

Other similar soils are present in Western Australia that may exhibit similar collapse potential and may not strictly be Pindan sands (i.e., have other grain-to-grain bonding mechanisms).

GDR5 SITE CLASSIFICATION

Site classification refers to the assessment of a site in reference to AS2870-2011, “Residential slabs and footings”. The method for assessing the site class is outlined in Section 2 of AS2870-2011, which indicates that this may be done by:

- assessing the characteristic surface movement, due to seasonal moisture changes in the soil profile;
- assessing the performance of existing foundations; or
- assessment of the soil profile (where there are deleterious inclusions, landfill, putrescible waste etc.).

The site classifications based on the expected characteristic surface movement are summarised in Table GDR 1.

Table GDR 1: Summary of Site Classifications (AS2870-2011)

Class	Description	Characteristic Surface Movement (y_s)
A	Most sand and rock site with little or no ground movement from moisture change	Not Defined (typically <5 mm)
S	Slightly reactive clay sites with only slight ground movement from moisture changes	0 – 20 mm
M	Moderately reactive clay sites, which may experience moderate ground movements from moisture change	20 – 40 mm
H1	Highly reactive sites, which may experience high ground movements from moisture change	40 – 60 mm
H2	Highly reactive sites, which may experience very high ground movements from moisture change	60 – 75 mm
E	Extremely reactive sites, which may experience extreme ground movements from moisture change	>75 mm
P	Sites which include soft soils, such as soft clay or silt or loose sands; landslip; mine subsidence; collapsing soils; soils subject to erosion; reactive sites subject to abnormal moisture conditions or sites which cannot be classified otherwise	Not Defined

The calculated characteristic surface movement is predominantly based on:

- the reactivity (i.e., the shrink-swell potential) of the soil (and any proposed fill);
- the design depth of soil suction change, which is the maximum expected depth of soil suction change due to seasonal soil moisture changes; and
- the depth to any bedrock and groundwater table.

The design depth of soil suction change for Western Australia has been refined using the Thornthwaite Moisture Index (TMI). We have carried out assessment using the depths as detailed in:

- Hu Y, Saraceni P, Cocks G, Zhou M (2016). "TMI assessment and climate zones in Western Australia". Australian Geomechanics Journal, Vol.51 No.3.
- Hu Y, Raj A, Cocks G, Verheyde F (2019). "Re-assessment of TMI based climate zones in metropolitan Perth, WA". ANZ Geomechanics Conference 2019, Perth Australia.

The design depth of soil suction change for Northern Territory is based on the research presented in:

- Jackson, S (2022), "Thornthwaite moisture index and climate zones in the Northern Territory", Australian Geomechanics Journal, Vol. 57 No. 3.

We highlight that AS2870-2011 does not make any reference to the fines content of a soil when assessing the site classification.

Where a site classification is provided in our reports, it is always predicated on the requirement that the recommended site preparation procedures are carried out.

We also highlight that the footing performance and shrink-swell movements of a site can be impacted by the planting or removal of trees. This should be considered where appropriate, and we refer to the CSIRO BTF 18-2011 "Foundation Maintenance and Footing Performance: A Homeowner's Guide" for further information.

AS 2870 is limited to single and double storey residential buildings with normal shallow footings with a maximum bearing pressure of 100 kPa and is not applicable where development types other than this are proposed.

GDR6 SITE PREPARATION

GDR6.1 General

The intent of the site preparation guidelines provided in the above report are to ensure that the earthworks can be constructed to meet specific requirements, i.e., minimum compaction, fill requirements, removal of unsuitable material etc. The site preparation guidelines are not exhaustive, and on-site conditions may dictate that other preparation measures may be required to meet geotechnical requirements.

GDR6.2 Site Preparation

Site preparation measures outlined in this section relate to bulk earthworks at the site in preparation for the construction of buildings, pavements and other structures.

The preparation of a site in accordance with outlined measures below or those presented in the report text does not imply that the site is suitable for heavily loaded plant or eccentric loads. This is especially applicable for working platforms for mobile plant including cranes, crawlers or the like. The site surface may still not be trafficable for mobile plant. Individual working platform assessments must be done if heavily loaded mobile plant are proposed.

GDR6.2.1 Common Measures

The common measures outlined below are to prepare standard sites in advance of proof compaction, bulk excavation and filling. These measures are applicable to most sites, however the applicability of these measures is stated in the main report.

Table GDR 2: Common Measures

Measure	Commentary
Demolish and remove structures and pavements	Demolish existing structures and pavements, including removal of all buried services and footings and dispose off-site.
Remove demolition debris and other deleterious material	Remove any demolition debris and other deleterious material from site including old footings, slabs, soak wells, buried services, paving and building rubble.
Strip uncontrolled fill (where present)	Strip any uncontrolled fill from the site (where encountered) and, if suitable, stockpile it for potential re-use as non-structural fill. If contaminated, dispose off-site. Refer to the report text for discussions on the presence of detected uncontrolled fill and its composition. It is important to realise that undetected uncontrolled fill may be present between test locations and the absence of its identification in our report does not preclude its presence. If uncontrolled fill is detected during site works, please contact us for inspection and to provide recommendations.
Remove trees	All tree roots must be removed, this may result in significant excavation in places. Where tree roots and stumps are removed, the disturbed soil must be over-excavated and replaced with controlled, compacted fill. Backfilling of over-excavations is discussed in the following sections .
Strip and stockpile topsoil.	Strip and stockpile topsoil from unpaved areas of the site for potential re-use in non-structural applications. The topsoil strip is only necessary to remove roots and we recommend a topsoil strip as necessary to remove all roots from the soil.
Carry out bulk excavation	Excavate to the required level. Stockpile suitable excavated material for potential re-use as fill (the re-use of spoil as fill , if appropriate, is discussed in the report text) and remove unsuitable or excess material off-site.
Batter edges of excavation	Excavations should be battered to a temporary slope as given in the report text where applicable and not in close proximity to adjacent structures etc. If required, construct temporary/permanent retaining walls where batters cannot be accommodated.

By following these measures, the site should have been prepared to a point where topsoil and vegetation has been removed to expose either natural soil or controlled fill. Over-excavation to the required levels may then be required for some projects. Once complete, the site is now ready for proof compaction and filling.

GDR6.2.2 Sand Sites

The preparation measures outlined below are provided for sand sites meeting the following criteria:

- Site underlain by sand.
- No collapsible soils present.
- No deep loose sand.
- Compaction of a loose upper horizon to maximum 1 m depth.
- No shallow groundwater (<1 m deep).
- No limestone or other rock present at shallow depth.
- “Common Measures” outlined in Section GDR6.2.1 have been completed (as required).

The applicability of these measures is stated in the main report. These measures must be carried out for all areas where structures, footings, pavements and any other settlement-sensitive infrastructure is proposed.

Unless specified otherwise in the report, the **Approved Fill** to be used is outlined in Section GDR8 (**Permeable Sand** where permeable fill is required, else **General Sand**). The specific selection is subject to the requirements of the civil designer.

Table GDR 3: Sand Site Measures

Measure	Commentary
Moisture condition and proof compact.	Moisture condition and compact the exposed sandy ground to achieve the density specified in Section GDR7.1 ("sand") to a depth of at least 900 mm.
Test proof compaction	Check that the density specified in Section GDR7.1 ("sand") has been achieved to a depth of at least 900 mm. We note that the applicability of the use of the PSP for compaction control is discussed in the report. Unless specifically approved for use on the subject site, the contractor must **not** assume that the use of the PSP is appropriate.
Treat areas of loose or unsuitable material	Any areas of loose sand or unsuitable material (including over-excavated areas of former trees and root balls) must be removed and replaced with **Approved Fill** as outlined in the report or as noted above. The report will explain the suitability of site-derived materials for re-use as approved fill.
Carry out bulk filling	Where fill is required to build up levels, use **Approved Fill**, placed and compacted in layers of no greater than 300 mm loose thickness. Test compaction to achieve the density specified in Section GDR7.1.

In following this method, shallow/surficial loose sand will be compacted, and the site will be filled (where required) in preparation for supporting footings, ground slabs, pavements and the like.

GDR6.2.3 Deep Loose Sand Sites

The preparation measures outlined below are provided for sand sites meeting the following criteria:

- Site underlain by sand.
- Collapsible soils or deep loose sand present (if applicable, this is discussed in the report).
- Over-excavation, compaction and replacement of loose sand required.
- No shallow groundwater (<1 m deep).
- No limestone or other rock present at shallow depth.
- "Common Measures" outlined in Section GDR6.2.1 have been completed.

The greatest depth of compaction that can be achieved with standard compaction equipment (vibrating roller, etc) is around 1 m (for sands). As such, it is necessary to cut down the site level to a point where this compaction can be done to the lowest level needed to be improved.

The applicability of these measures is stated in the main report. These measures must be carried out for all areas where structures, footings and any other settlement-sensitive infrastructure are proposed. Not typically required for pavement subgrades, however, this is discussed in the report if required.

Unless specified otherwise in the report, the **Approved Fill** to be used is outlined in Section GDR8 (**Permeable Sand** where permeable fill is required, else **General Sand**). The specific selection is subject to the requirements of the civil designer.

Table GDR 4: Deep Loose Sand Site Measures

Measure	Commentary
Over-excavate to the required depth.	Over-excavate sand soil to the depth stated in the report and, if appropriate (discussed in report) retain it for re-use as fill. Over-excavation is likely to be done in stages depending on the site area available for earthworks. Excavations must be battered to a temporary slope as given in the report text where applicable and not in close proximity to adjacent structures etc. If required, construct temporary/permanent retaining walls where batters cannot be accommodated.
Moisture condition and proof compact.	Moisture condition and compact the exposed sandy ground to achieve the density specified in Section GDR7.1 ("sand") to a depth of at least 900 mm.
Test proof compaction	Check that the density specified in Section GDR7.1 ("sand") has been achieved to a depth of at least 900 mm. We note that the applicability of the use of the PSP for compaction control is discussed in the report. Unless specifically approved for use on the subject site, the contractor must **not** assume that the use of the PSP is appropriate.
Treat areas of loose or unsuitable material	Any areas of loose sand or unsuitable material (including over-excavated areas of former trees and root balls) must be removed and replaced with compacted **Approved Fill** as outlined in the report or as noted above. The report will explain the suitability of site-derived materials for re-use as approved fill.

Measure	Commentary
Carry out bulk filling	Where fill is required to build up levels (including restoration of the site surface level to the original level), use **Approved Fill**, placed and compacted in layers of no greater than 300 mm loose thickness. Test compaction as specified in Section GDR7.1.

In following this method, deep, loose sand will be compacted to a sufficient depth to reduce settlement impacts and the site will be filled (where required) in preparation for supporting footings, ground slabs, pavements and the like.

GDR6.2.4 Clayey Sites

The preparation measures outlined below are provided for sand sites meeting the following criteria:

- Site underlain by cohesive soils (typically >12% fines, i.e., clayey enough for the fines proportion of the soil to dominate behaviour).
- No collapsible soils present.
- No deep soft soils or organic soils.
- Over consolidated clayey soils present which will not be subject to significant primary or secondary consolidation (settlements expected to be within the limit of typical seasonal movements occasioned by moisture content changes, which would be captured in assignment of an AS2870 site classification).
- No shallow groundwater (<1 m deep)
- No rock present at shallow depth.
- "Common Measures" outlined in Section GDR6.2.1 have been completed.

The applicability of these measures is stated in the main report. These measures must be carried out for all areas where structures, footings, pavement subgrades and any other settlement-sensitive infrastructure is proposed.

Unless specified otherwise in the report, the **Approved Fill** to be used is **Clay** as outlined in Section GDR8.

Table GDR 5: Clay Site Measures

Measure	Commentary
Moisture condition and proof compact.	Moisture condition and compact the exposed clayey ground to achieve the density specified in Section GDR7.1 ("fine grained soils") to a depth of at least 300 mm.
Test proof compaction	Check that the density specified in Section GDR7.1 ("fine grained soils") has been achieved to a depth of at least 300 mm. The use of a penetrometer for compaction control of cohesive soils is not an appropriate substitute for in situ NDG testing.
Treat areas of loose or unsuitable material	Any areas of soft clayey soils or unsuitable material (including over-excavated areas of former trees and root balls) must be removed and replaced with compacted **Approved Fill**. The report will explain the suitability of site-derived materials for re-use as approved fill.
Carry out bulk filling	Where excavations are done into clayey soils (e.g. to treat soft zones, remove root balls and the like), they must not be backfilled filled with sand fill (even where a sand topping layer is proposed). Where fill is required (including backfilling of excavations to remove trees), only use **Approved Fill**, moisture conditioned, placed and compacted in layers of no greater than 300 mm loose thickness. Test moisture and compaction as specified in Section GDR7.1.
Grade completed clayey surface	Surface water control is essential for clayey sites. This also applies to control of infiltrated water into sand topping layers or the like. The surface of clayey ground must be graded at a minimum of 1% crossfall to drain. This is a general recommendation, and an appropriate civil design must be done to account for surface and subsoil drainage.
Install sand topping layer	Where a sand topping layer is proposed, this should be done as outlined in Section GDR6.2.5.

These measures do not take into account the objectives of the civil design for the site, particularly with regard to surface water drainage and groundwater control (including clay grading, subsoil drainage, thickness and composition of a sand topping layer and the like). This must be taken into account by the civil designer. General commentary on drainage control measures is presented in Section GDR14.

GDR6.2.5 Sand Topping Layer

Where a sand topping layer is required:

Unless specified otherwise in the report, the **Approved Fill** to be used is outlined in Section GDR8 (**Permeable Sand** where permeable fill is required, else **General Sand**). The specific selection is subject to the requirements of the civil designer.

Table GDR 6: Sand Topping Layer Measures

Measure	Commentary
Prepare Substrate	Prepare the clayey or other substrate as separately outlined prior to installing the topping layer.
Build up sand topping layer	Build up level to the required level with **Approved Fill**, placed and compacted in layers of no greater than 300 mm loose thickness to achieve the density specified in Section GDR7.1.

For the purposes of achieving the allowable bearing pressures and site classification discussed in the report, it is not necessary to have the bases of slabs and footings in the sand topping layer, i.e. if required, they may extend through the sand topping layer into clayey soil below.

GDR6.2.6 Limestone Sites

The preparation measures outlined below are provided for sites underlain by limestone (refer to Section GDR4.1), meeting the following criteria:

- Site underlain by sand overlying limestone.
- Compaction of a loose upper horizon to maximum 1 m depth, with localised deeper treatments between pinnacles if required.
- No shallow groundwater (<1 m deep)
- “Common Measures” outlined in Section GDR6.2.1 have been completed.

The site preparation measures outlined below are aimed at improvement of the site in preparation for construction of the structures including on-ground slabs, shallow footings, retaining walls and pavements.

Unless specified otherwise in the report, the **Approved Fill** may comprise one of the following as specified in Section GDR8 (the specific selection is subject to the requirements of the civil designer):

- **Permeable Sand** where permeable fill is required
- **General Sand** where permeable fill is not required
- **Mixed Sand/Limestone Fill** where permeable fill is not required

The re-use of any limestone for fill is subject to the requirements of the civil design and discussions in the report text. The use of **Mixed Sand/Limestone Fill** is discussed in Section GDR6.2.7. The preparation measures outlined in Table GDR 7 assume sand fill.

Table GDR 7: Standard Limestone Site Measures (Bulk Earthworks)

Measure	Commentary
Treat zones of loose sand	Where deep loose sand is present (particularly, but not exclusively, between limestone pinnacles), over-excavate to the depth as noted in the report . Sand should be retained for re-use as fill if recommended in the report. Limestone debris and pinnacles should be separated and only re-used if recommended in the report.
Moisture condition and proof compact.	Moisture condition and compact the exposed sandy ground to achieve the density specified in Section GDR7.1 ("sand") to a depth of at least 900 mm. Proof compaction of intact limestone is not required.
Test proof compaction	Check that the density specified in Section GDR7.1 ("sand") has been achieved to a depth of at least 900 mm. We note that the applicability of the use of the PSP for compaction control is discussed in the report. Unless specifically approved for use on the subject site, the contractor must not assume that the use of the PSP is appropriate. If refusal to the test method is encountered within the target test depth on limestone and the results to the refusal depth are acceptable, it is not necessary to repeat compaction testing at that location. Compaction control of intact limestone is not required.
Treat areas of loose or unsuitable material	Any areas of loose sand or unsuitable material (including over-excavated areas of former trees and root balls) must be removed and replaced with compacted **Approved Fill** as outlined in the report or as noted above. The report will explain the suitability of site-derived materials for re-use as approved fill.
Carry out bulk filling	Where fill is required to build up levels, use **Approved Fill**, placed and compacted in layers of no greater than 300 mm loose thickness. Test compaction to achieve the density specified in Section GDR7.1.

These measures do not take into account the specifics of the civil design, including the requirement (if any) for excavatable and/or free draining layers to achieve construction and drainage objectives. The civil design must take precedence and is not specifically considered in this advice.

Soakwells can perform poorly in limestone and specific advice may apply to the installation of soakwells in limestone areas. If not discussed in our report, please contact us for further advice.

Without further consultation with the structural designer, footings for any one structure must not be founded on a mixture of sand and intact limestone. This is due to potential differential settlements between limestone zones (relatively stiff) and soil zones (relatively soft). Where this is the case, the measures outlined in Table GDR 8 must be followed, only with guidance from the structural designer and Galt.

Table GDR 8: Standard Limestone Site Measures (Footing and Slab Preparation)

Measure	Commentary
Excavate and compact for slabs, subgrades, pad or strip footings	Excavate for pad and strip footings. Where a mix of soil and limestone is present below any one structure, one of the following must be done (to be agreed with structural designer and us): ▪ **Over-excavate limestone and replace with compacted soil:** Typically where the foundation largely comprises soil and a relatively small amount of limestone is present. Where footings and slabs are founded partly on soil and partly on limestone, over-excavate the limestone by at least 300 mm below the base of footing or slab and replace the excavated material with compacted **Approved Fill**. ▪ **Remove soil from over limestone and replace with concrete**: Typically where the foundation largely comprises limestone and a relatively small amount of soil is present. Localised zones of sand and mixed sand/limestone rubble must be removed and replaced with lean-mix concrete, e.g. 10 MPa blinding concrete. ▪ **Design the structure to accommodate differential foundation movements:** For example, include construction joints or use a more heavily reinforced footing (subject to the structural designer's requirements).
Test compaction of footing bases, slabs or subgrades.	Compact the exposed bases to achieve the density specified in Section GDR7.1 ("sand"), to a depth of at least 900 mm, or to the depth where limestone is intersected. If refusal to the test method is encountered within the target test depth on limestone and the results to the refusal depth are acceptable, it is not necessary to repeat compaction testing at that location. Compaction control of intact limestone is not required. Remove, replace and compact as required with approved fill any zone not achieving the density specified in Section GDR7.1 ("sand")

GDR6.2.7 Mixed Sand/Limestone Filling

On sites where deemed appropriate by the Civil Design, **Approved Fill** may comprise limestone rubble fill (**Mixed Sand/Limestone**, as specified in Section GDR8).

The preparation measures outlined below are provided for sites meeting the following criteria:

- No shallow groundwater (<1 m deep)
- "Common Measures" outlined in Section GDR6.2.1 have been completed.
- Substrate preparation for the relevant site type has been done in preparation for further filling (as relevant for sand, limestone or clayey sites discussed in the preceding sections).

The site preparation measures outlined below are required prior to construction of structures including on-ground slabs, shallow footings, retaining walls and pavements.

Table GDR 9: Mixed Sand/Limestone Fill Measures

Measure	Commentary
Develop a method specification for the filling	A performance specification is not appropriate for compaction control in **Mixed Sand/Limestone** fill, due to oversize limestone particles and the limitations of test methods. Therefore, a method specification is required. Development of a method specification is discussed in Section GDR7.5. A tentative method specification for **Mixed Sand/Limestone** Fill preparation is also provided.
Carry out bulk filling	Where fill is required to build up levels, use **Approved Fill**, placed and compacted in accordance with the developed method specification.
Maintain Construction Records	As performance testing cannot be done, quality assurance records are limited. Therefore, the parameters mentioned in Section GDR7.5.1 must be kept in a comprehensive record of the earthworks done to the developed method specification. The use of the PSP is possible only to check for loose sand zones between limestone particles. High PSP blow counts, where limestone particles are intersected, are meaningless in terms of assessing density of the prepared fill. The primary means of validation of the earthworks is conformance with the developed method specification.
Install sand topping layer	Where a sand topping layer is proposed, this should be done as outlined in Section GDR6.2.5.

These measures do not take into account the specifics of the civil design, including the requirement (if any) for excavatable and/or free draining layers to achieve construction and drainage objectives. The civil design must take precedence and is not specifically considered in this advice.

Soakwells can perform poorly in limestone fill and specific advice may apply to the installation of soakwells in limestone fill areas. If not discussed in our report, please contact us for further advice.

GDR6.2.8 Rock Sites

The preparation measures outlined below are provided for sites underlain by rock, meeting the following criteria:

- Site underlain by shallow soil overlying rock, or outcropping rock.
- No shallow groundwater or surface water (>1 m deep).
- Common site preparation measures outlined in GDR6.2.1 have been completed. In addition to these measures, any surface cobbles/boulders will need to be removed from the site.

The site preparation measures outlined below are aimed at improvement of the site for construction of structures including on-ground slabs, shallow footings, retaining walls and pavements.

Approved Fill will be as specified in this report. The re-use of any rock for fill is subject to the civil design requirements and any other requirements noted in the report text. The preparation measures outlined below assume **Approved Fill**.

Table GDR 10: Standard Rock Site Measures (Bulk Earthworks)

Measure	Commentary
Moisture condition and proof compact.	Moisture condition and compact the exposed ground (soil above rock) to achieve the density specified in Section GDR7.1 to a depth of at least 300 mm. Proof compaction of rock is not required.
Test proof compaction	Check that the density specified in Section GDR7.1 has been achieved to a depth of at least 300 mm. in situ NDG testing is suitable to assess compaction. Compaction control of intact rock is not required.
Treat areas of loose or unsuitable material	Any areas of loose / soft or unsuitable material (including over-excavated areas of former trees and root balls) must be removed and replaced with compacted **Approved Fill** as outlined in the report or as noted above. The report will explain the suitability of site-derived materials for re-use as **Approved Fill.**
Carry out bulk filling	Where fill is required to build up levels, use **Approved Fill**, placed and compacted in layers of no greater than 300 mm loose thickness. Test compaction to achieve the density specified in Section GDR7.1.
Grade surface	Surface water control may be required for lower permeability soils/rock, or at an interface where high permeability fill is placed over relatively impermeable soils/ rock. The surface of any impermeable ground / rock must be graded at a minimum of 1% crossfall to drain. This is a general recommendation, and an appropriate civil design must be done to account for surface and subsoil drainage.

These measures do not take into account the specifics of the civil design, including the requirement (if any) for excavatable and/or free draining layers to achieve construction and drainage objectives. The civil design must take precedence and is not specifically considered in this advice.

Soakwells can perform poorly in rock and specific advice may apply to the installation of soakwells in these areas. If not discussed in our report, please contact us for further advice.

Without further consultation with the structural designer, footings for any one structure must not be founded on a mixture of sand and rock. This is due to potential differential settlements between rock zones (relatively hard) and soil zones (relatively soft). Where this is the case, the measures outlined below must be followed, only with guidance from the structural designer and Galt.

Table GDR 11: Standard Rock Site Measures (Footing and Slab Preparation)

Measure	Commentary
Excavate and compact for slabs, subgrades, pad or strip footings	Excavate for pad and strip footings. Where a mix of soil and rock is present below any one structure, one of the following must be done (to be agreed with structural designer and us): ▪ **Over-excavate rock and replace with compacted soil:** Typically where the foundation largely comprises soil and a relatively small amount of rock is present. Where footings and slabs are founded partly on soil and partly on rock, over-excavate the rock by at least 300 mm below the base of footing or slab and replace the excavated material with compacted **Approved Fill**. ▪ **Remove soil from over rock and replace with concrete**: Typically where the foundation largely comprises rock and a relatively small amount of soil is present. Localised zones of sand and mixed sand/rock rubble must be removed and replaced with lean-mix concrete (e.g. 10 MPa blinding concrete) or cement stabilised sand (minimum UCS=2 MPa at 7 days). ▪ **Design the structure to accommodate differential foundation movements:** For example, include construction joints or use a more heavily reinforced footing (subject to the structural designer's requirements).

Measure	Commentary
Test compaction of footing bases, slabs or subgrades.	Compact the exposed bases to achieve the density specified in Section GDR7.1, to a depth of at least 300 mm, or to the depth where rock is intersected. If refusal to the test method is encountered within the target test depth on rock and the results to the refusal depth are acceptable, it is not necessary to repeat compaction testing at that location. Compaction control of intact rock is not required. Remove, replace and compact as required with **Approved Fill** any zone not achieving the density specified in Section GDR7.1.

GDR6.3 Guidance on Sites with Cohesive Soils

Cohesive soils (most commonly, "clayey" soils) require careful moisture conditioning to facilitate compaction. We recommend that the moisture content of the material is between optimum moisture content (OMC) and 2% wet of OMC at the time of placement and compaction. We note that compaction to the densities specified in Section GDR7.1 can be difficult to achieve for clayey material when not appropriately moisture conditioned.

Vibratory padfoot rollers are preferred for compacting cohesive fill to promote proper kneading and interlocking of subsequent layers.

Clayey soils will drain poorly when inundated following rain events and result in saturated conditions that may inhibit compaction of the soil. In general, it is preferable to avoid trying to re-work clayey sites within several days of any substantial rainfall.

We recommend that the surfaces of clayey sites are sealed by compaction (i.e., final compaction should be with a smooth drum roller) and graded to drain (to avoid low spots where water can pond and cause softening) prior to any rain events. Stripping back of softened materials to expose competent natural or compacted clayey soil is required before continuing earthworks.

If difficulties are experienced during compaction due to water, further advice should be sought from a geotechnical engineer.

GDR6.4 Preparation and Testing of Shallow Footings

GDR6.4.1 General

It is preferable to dig all footing excavations carefully with a flat-edged bucket to minimise the disturbance of underlying foundation soil.

Where the footing base is disturbed, or compaction is required, this must be done using appropriate compaction equipment particular to the task (as evaluated by the contractor) – typically a 'jumping jack', self-propelled plate compactor or an excavator-mounted plate compactor.

All footing bases must be tested to achieve the density requirements of Section GDR7.1 unless otherwise specified. PSP testing of sand foundations is only applicable where the use of the PSP is specifically approved in the report, otherwise all testing is to be done using the NDG.

Sand Topping Layer – Where a sand topping layer is present over a different soil (i.e., clay, limestone etc.), testing of the density of the sand topping layer is only necessary within the thickness of the sand topping layer. Testing does not need to extend into the underlying compacted substrate, which is separately subjected to compaction control.

Mixed Sand/Limestone Fill – Where mixed sand/limestone fill has been installed to a method specification, no compaction control testing is required, however re-compaction of the base must be done as noted above.

In situ limestone – where in situ limestone (weakly or more cemented limestone, with no sand zones or voids) is present at a footing base and no over-excavation has been done (refer to Section GDR6.2.6 regarding over-excavation of footing bases in limestone), then no compaction control testing is required.

Where loose or soft material is encountered, one of the following actions must be taken:

- Over-excavate the loose / soft layer to expose a suitable layer that does meet the required density (Section GDR7.1) and either:
- Place and compact Approved Fill (relevant to the appropriate preparation measures outlined in Section GDR6.2) to achieve the required density (Section GDR7.1); or

- Pouring blinding concrete (f'c>15 MPa at 28 days) from the competent layer up to the underside of the footing.

All foundations must be assessed by a competent person prior to blinding.

GDR6.4.2 Footings in Clay

Where footings are excavated into natural clay and not subject to filling, density testing (e.g., NDG testing) is not required at the base of the footings. This will be highlighted in the report text if this is relevant to the site conditions. Footing bases must be dug with a flat-edged excavator bucket and the underlying soil not disturbed by trafficking or over-excavation.

In these instances, only testing with a DCP is required in accordance with AS1289.6.3.2 at the footing base to achieve the required blow counts indicated in the report text, to a minimum depth of 0.6 m below the base of the footing, or other depth as indicated in the report text. Where the minimum blow count specified cannot be met, the following options are possible to prepare the footing base:

- Scarify, moisture condition and re-compact all zones not achieving the minimum blow counts. Re-test with a DCP to confirm that any soft zones are remediated; or
- Over-excavate and replace all zones not achieving the minimum blow counts with a suitable compacted low permeability fill (e.g., crushed limestone, clayey fill or other approved fill). This fill must be compacted to the appropriate level as specified in GDR7; or
- Over-excavate and replace all zones not achieving the minimum blow counts with blinding concrete (min. 10 MPa at 28 days) or cement-stabilised sand (min. 2 MPa at 7 days). This is typically appropriate where only the upper zones below the footing base are soft.

Measures must be taken to minimise moisture changes in clayey foundation soils at the base of footing excavations. Concrete footings are to be poured soon after excavation to minimise the potential for excessive moisture change. The use of a concrete blinding layer following foundation preparation should be considered.

GDR7 COMPACTION AND MOISTURE CONDITIONING

GDR7.1 Requirements

Any soil within the significant founding zone of structures (buildings, slabs, pavements, etc.) must be suitably moisture conditioned and compacted. These soils must be compacted to the requirements as outlined below.

Table GDR 12: Compaction and Moisture Requirements

Soil Description	Soil Particle Limits	Moisture Requirement	Density Requirement (DDR)	Possible QA/QC Test Methods
Sand	<5% fines <5% gravel *Maximum particle size 9.5 mm*	MOMC ±2%	95% MMDD	PSP NDG
Gravel	<5% fines >50% gravel *Maximum particle size 19.0 mm*	MOMC ±2%	95% MMDD	NDG
Clayey/Silty Gravel	5-35% fines >50% gravel *Maximum particle size 19.0 mm*	MOMC ±2%	95% MMDD	NDG
Sand with fines or gravel	5-35% fines; and/or 5-50% gravel *Maximum particle size 19.0 mm*	MOMC ±2%	95% MMDD	NDG Method Specification
Fine grained soils (Clayey or Silty)	>35% fines *Maximum particle size 19.0 mm*	MOMC ±2%; or SOMC ±2%[2]	92% MMDD; or 95% SMDD	NDG Method Specification
Oversize/rubbly soil	Any soils with particles >19.0 mm	MOMC ±2%	95% MMDD (Or equivalent to)	Method Specification Detailed Assessment Based on Specific Material

NOTES: ***1.*** *DDR – Dry Density Ratio*

MMDD – Modified maximum dry density (AS1289.5.2.1)
MOMC – Modified optimum moisture content (AS1289.5.2.1)
SMDD – Standard maximum dry density (AS1289.5.1.1)
SOMC – Standard optimum moisture content (AS1289.5.1.1)
PSP – Perth Sand Penetrometer
NDG – Nuclear Density Gauge

2. *Preferably OMC to OMC +2%, for ease of compaction and producing a homogenous fill*
3. *Test frequencies are specified in Section GDR7.6.*

The soil groups and definitions outlined above are generally based on AS1726-2017. Test methods are discussed in subsequent sections.

GDR7.2 Construction Recommendations

Over-excavation and replacement of loose material must be done where the minimum DDR cannot be achieved.

Fill must be placed in horizontal layers of not greater than 300 mm loose thickness. Each layer must be compacted by suitable compaction equipment, and carefully controlled to ensure even compaction over the full area and depth of each layer.

Care will need to be taken if compacting in the vicinity of existing structures, such as the adjacent properties. This is particularly important if vibratory compaction is being carried out.

- Tynan (1973), "Ground Vibration and Damage Effects on Buildings", Australia Road Research Board, Special Report No. 11.

Tynan (1973) provides guidance on the selection of compaction equipment for use adjacent to structures. The distance of influence (i.e., the definition of "vicinity") will vary depending on the size of compaction plant proposed for use. Where there is concern regarding the impact on nearby structures, a dilapidation study should be done.

Care must be taken when compaction is undertaken when the site surface is within 1 m of the groundwater level, as compaction (particularly with vibration) can draw the water up to the surface. In this instance, consideration should be given to:

- Static rolling only;
- Using a pioneering layer (if possible); or
- Dewatering to keep the water at least 1 m below the surface being compacted.

GDR7.3 Nuclear Density Gauge

Where applicable, a nuclear density gauge (NDG) must be used in accordance with AS1289.5.8.1. NDG tests must be done to a depth of 300 mm or as otherwise indicated in the text of the attached report.

GDR7.4 Perth Sand Penetrometer

Where clean sand is used (<5% fines and <5% gravel), a Perth sand penetrometer (PSP) may be used for compaction control in accordance with AS1289.6.3.3. Refer to the report for recommended blow counts correlating to the specified density.

Where the fines or gravel contents of a sand soil exceed the maximum contents noted above, a PSP must not be used exclusively for compaction control. As a minimum, ongoing confirmation testing with an NDG is required. If not specified in our report, please contact us for further advice regarding test frequencies.

If difficulties are experienced recording the required blow counts, a site-specific PSP correlation should be carried out to determine the PSP blow count correlating to a DDR of 95% MMDD. In addition, a particle size distribution (PSD) test should be carried out to verify that the use of a PSP is suitable for the sands being tested. A site-specific PSP correlation must:

- be done on site;
- use the nuclear density gauge (NDG) to determine density at a minimum of 5 points with varying density to a depth of 300 mm below surface;
- include at least 1 point where the dry density ratio is in excess of 95% MMDD;
- use a calibrated PSP to determine the PSP blow count from 150 mm to 450 mm at each NDG test point; and
- be plotted on a chart of PSP blow count vs DDR.

Only where specifically stated as applicable in the report and where the use of the PSP is relevant as noted above, the following values may be taken as deemed to conform to a dry density ratio of 95% MMDD for the relevant sand type.

Table GDR 13: Deemed-to-comply Values for PSP Results in Perth Sands

Depth Interval (mm)	Bassendean	Tamala	Calcareous
0-150	SET	SET	SET
150-450	7	8	12
450-750	9	10	14
750-1050	11	12	16

NOTES:
1. *Blows per 300 mm interval*
2. *Bassendean Sand is typically a white - grey, low-fines quartz sand found on the eastern part of the Perth coastal plain*
3. *Tamala / Spearwood sand is typically yellow or orange, low-fines quartz sand found on the western part of the Perth coastal plain*
4. *Calcareous sands are typically white or yellow, calcareous sand found in low-lying areas on the western fringe of the Perth coastal plain*
5. *Values derived from Galt experience on PSP correlations done on sites across Perth for the 150-450 mm interval.*

GDR7.5 Method Specifications

GDR7.5.1 General

Where proposed, a method specification should be developed by a geotechnical engineer or similarly qualified person and ratified by us (including a site visit by us). The method specification should be confirmed by the construction of a trial pad or trial area and the compaction methodology should be checked against either:

- density, as assessed using a nuclear density gauge; or
- settlement, as assessed using a dGPS.

Specific advice should be requested for the development of a method specification, taking into consideration the material being compacted.

Method specification compliance should be maintained for all areas on a minimum 20 m grid, with the compliance to include:

- Roller used (weight, style, vibration);
- Water application rate (per lift);
- Layer thickness placed; and
- Number of passes with roller.

GDR7.5.2 Indicative Method Specification – Sand/Limestone Rubble Mix

Where mixed sand/limestone is used as structural fill, a performance specification is not appropriate due to the inaccuracies of standard test methods (NDG/PSP etc.) in this type of material. A method specification can be used instead. The following indicative method specification is provided for evaluation and trial but must be trialled and ratified by us prior to widespread employment on site. The following would be typically adopted:

- Maximum particle size: 250 mm
- Maximum loose layer thickness: 350 mm
- Minimum watering rate: 10 L/m^2/100 mm thickness of loose material (e.g. 35 L/m^2 for a 350 mm thick layer)
- Minimum 8 passes with a vibrating padfoot roller, minimum static weight 10 tonnes.
- The compacted fill must comprise closely packed particles without any significant voids between the larger particles.

GDR7.6 Testing Frequency

After compaction, verify that the required density has been achieved by testing at the base of excavation and through the full depth of any fill, and to a minimum depth of:

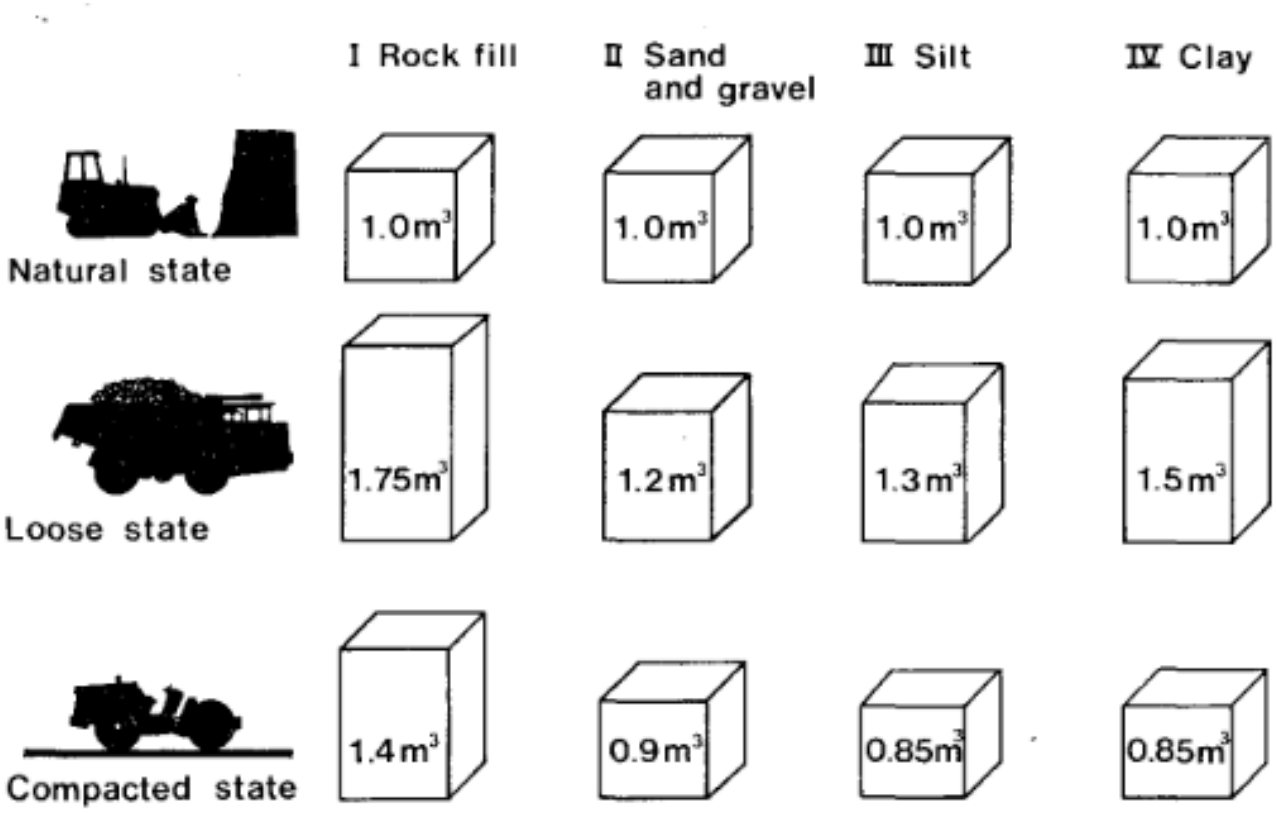
- 900 mm where a PSP is used; or
- 300 mm where a NDG is used.

The frequency of testing (when a method specification is not used) should be as follows:

Table GDR 14: Compaction Testing Frequency Requirements

Area	Minimum Testing Frequency	Minimum Tests Per Lot
Proof Compacted Area	1 test per 1,000 m^2 (30 m grid)	2
Structural Fill Outside of Building and Pavement Footprints	1 test per 500 m^3 2 tests per layer *Whichever is greater*	2
Structural Fill Within Building and Pavement Footprints	1 test per 500 m^3 4 tests per layer *Whichever is greater*	4
Spread/Pad Footings	1 test per 9 m^2 per footing	1
Strip Footings/Retaining Wall Foundations	Minimum 2 tests At 5 m centres *Whichever is greater*	2
On-ground slabs, pavements and rafts	Minimum 2 tests At 10 m centres 1 test per 100 m^2 *Whichever is greater*	2

NOTES: ***1.*** *A 'lot' is defined in the context of this section as a section of earthworks that is undertaken in one operation where the equipment, personnel, materials and methodology are consistent throughout the entire process. This would typically be limited to operations done in one day, but this is not mandatory.*



2. *There will frequently be multiple 'lots' in an earthworks process, therefore the number of tests must be adjusted according to the minimum number per lot in this table (where this is more than the frequency specified in 'testing requirements').*

GDR7.7 Bulking and Compaction Factors

All soils will "bulk" when excavated to stockpile, and "compact" when placed from stockpile to earthworks layers. Published bulk and compaction factors are presented below for conventional materials, taken from:

- Forssblad, L (1981), "Vibratory Soil and Rock Fill Compaction", Dynapac Maskin AB

Inline Image GDR 3: Volumes of Different Types of Fill Materials in Natural, Loose and Compacted State

These values are indicative only and will vary according to site specific conditions. The values provided here must not be used for commercial volume estimates or settling disputes regarding volumes.

GDR8 APPROVED FILL AND CONFORMANCE TESTING

Imported fill must comply with the material requirements as stated in AS 3798-2007, “Guidelines on Earthworks for Commercial and Residential Developments”.

Where doubt exists, a geotechnical engineer must be engaged to inspect and approve the use of potential fill materials.

The following table presents recommended material parameters for standard fill types. This does not take account of availability of materials either on site or in the local area. Refer to the report text for specific advice on fill at the subject site.

Table GDR 15: Standard Fill Recommendations

Soil Description	Application	Soil Particle Limits (%)[3]				k_{min}[1] (m/d)	OC[2] (%)	Atterberg Limits		CBR[6] (%)	Test Method[4]
		Fines	Sand	Gravel	Max.			LL (%)	PI (%)		
Permeable Sand	Permeable bulk fill Retaining wall backfill Permeable select fill	≤5	≥90	≤5	9.5	5	≤2	NP	NP	≥12	PSP NDG
General Sand	Bulk fill Select fill (permeability not required)	≤5	≥90	≤5	9.5	N/A	≤2	NP	NP	≥12	PSP NDG
Silty Sand	Bulk fill Select fill	≤35	≥55	≤10	9.5	N/A	≤2	<35	<11	≥12	NDG
Clayey Sand	Bulk fill Select fill	≤35	≥55	≤10	9.5	N/A	≤2	<40	N/A	≥12	NDG
Granular Fill	Bulk Fill	≤30[10]	Varies[10]	Varies[10]	37.5	N/A	≤2	<40	N/A	N/A	NDG
Mixed Sand/Limestone	Bulk fill (permeability not required)	≤5	≥20	≤80	250	N/A	≤2	NP	NP	N/A	NDG Method
Blue Metal Gravel[8]	Retaining wall backfill Drainage trench backfill	≤3	≤5	≥90	37.5	5	≤1	NP	NP	N/A	NDG
Clay[7]	Reinstatement of localised excavations in clay Bulk fill	≥12	Varies	≤30	19	N/A	≤2	Varies			NDG

NOTES:

1. *k_{min} – minimum saturated hydraulic conductivity (AS1289.6.7.1, remoulded to minimum DDR 100% MMDD).*
2. *OC – organic content (Walkley-Black method recommended, AS1289.4.1.1 – not loss on ignition methods)*
3. *% by mass.*
4. *Test method indicates possible compaction control methods for this material.*
   PSP – Perth sand penetrometer (AS1289.6.3.3). Where a PSP is used, a site-specific correlation must be done unless otherwise noted in the report.
   NDG – Nuclear density gauge (AS1289.5.8.1)
   Method – method specification
5. *Atterberg Limits: LL – liquid limit PI – plasticity index NP – non-plastic*
6. *CBR: California bearing ratio (for sand - remoulded to DDR 95% MMDD @ OMC, 4.5 kg surcharge). CBR values may be changed depending on the design pavement requirements.*
7. *"Clay" fill type is included for broad reference only and to illustrate preferred applications, particle size limits and recommended test method. Specific discussion on the use of clayey fills is included in the report text if applicable. Atterberg limit and CBR testing of clayey fills may be required and advice must be sought from us if not stated in the report.*
8. *"Blue metal" gravel refers to single sized, crushed, washed igneous rock gravel used for drainage purposes.*
9. *In the absence of specific test frequencies by the civil designer, the testing shown in Table GDR 16 must be done (highlights in Table GDR 15 show where the test is required).*
10. *Sand and gravel must be reasonably graded to control the risk of soil ingress from surrounding layers. Where the fines content is high (e.g. above ~15%), the gravel content should proportionally increase to meet the requirements for "granular fill". We recommend a minimum gravel content of 30% where the fines content is above 15%.*

Table GDR 16: Conformance Testing Frequency Requirements

Parameter	Frequency (m^3)	Minimum Tests per Source	AS1289 Reference
Particle size distribution	5,000	1	3.6.1
Hydraulic conductivity (permeability)	10,000	2	6.7.1
Organic content	5,000	1	4.1.1
Atterberg limits	5,000	1	3.1.1, 3.2.1, 3.3.1
CBR	10,000	2	6.1.1

NOTES: ***1.*** *Frequency is for the nominal number of cubic metres of compacted fill.*

2. *Unless stated otherwise in the report text, the conformance testing must also be carried out on site-derived materials to confirm suitability.*

GDR9 SHALLOW FOUNDATIONS

GDR9.1 Design

Footings and slabs may be designed in accordance with the assigned site classification in accordance with AS2870-2011. We note that AS2870-2011 is limited to single and double storey residential and commercial developments and may not be strictly applicable.

Where the report provides tables for shallow footing design, custom footings may be designed by the structural engineer using the data provided therein.

GDR9.2 Interpretation of Provided Values

BEARING PRESSURES

All settlement and bearing pressures estimates are provided on the assumption that the site preparation requirements outlined in the report are completed below all structures plus a minimum distance of 1 m beyond the outside edge of any footing or slab. It is essential that the soil below all foundations is appropriately prepared as outlined and meets the relevant compaction requirements.

Allowable bearing pressures for footings of intermediate plan dimensions (to any tabulated) can be interpolated. Footings that have a plan dimension either smaller or larger than those presented in the report will need to be considered individually along with other embedment depths.

Allowable bearing pressures, where provided, are considered to be the upper limit for shallow footings to limit total and differential settlements. Footings carrying eccentric loading, such as below retaining walls, must be assessed separately.

SETTLEMENTS

The reporting of settlements to any precision level is not intended to imply a high accuracy of settlement prediction. Settlements as reported should be considered ‘order of magnitude’.

Estimated settlements represent vertical downwards movement due to loading and do not take into account potential additional movement associated with the characteristic surface movement of the soil (which must be taken in addition to these settlements from loading, refer Section GDR5). The site classification is discussed in the report.

The actual settlement of any proposed structure will depend upon a number of factors including the applied pressures, footing size and base preparation. The estimated settlement(s) provided in this report are for the working bearing pressures as indicated. Differential settlements are likely between footings of similar sizes, loads and elevations (as stated in the report text). A proportion of the settlement is expected to occur during construction (i.e., during initial loading.

The provided settlement estimates (unless otherwise stated) do not include interaction effects from footings founded near other footings (i.e., groups of footings). Interaction effects will need to be considered if the spacing between adjacent footings is smaller than the dimension of the footings (i.e., the centre-to-centre spacing between footings is less than twice the width of the footing). This could act to double provided settlements, dependent on the footing configuration. Where an assessment of footing groups is required, a more detailed numerical or finite-element modelling analysis would need to be undertaken.

CREEP AND CONSOLIDATION

Creep settlement is an irreversible component of long-term soil settlement caused by sustained vertical stress. Consolidation is a time-dependent irreversible compression in a soil layer caused by a reduction in pore pressure between soil particles. Both creep and consolidation can occur in natural materials as a result of earthworks or the placement of loads on to soil layers. The settlements as presented for short-term loading do not include consideration for creep and consolidation settlements unless specifically stated.

GDR9.3 Raft Foundations

Where moduli of subgrade reactions are provided for the design of raft foundations, we highlight that these are an estimate of the elastic reaction of the soil. The values are provided based on an expected load and loaded area size. Soils are typically non-linear in their response and will have different stiffnesses at different levels of strain and load repetitions. This is due to the physical interaction of soil particles under different levels of stress.

The possibility of a non-linear response must be considered by the designer of any raft foundation.

GDR10 PILED FOUNDATIONS

Piles must be designed and tested in accordance with AS2159-2009, “Piling – Design and Installation”. We use the following interpretation/design methods to provide pile design parameters:

- Franki Africa Pty Ltd (2008) “A Guide to Practical Geotechnical Engineering in South Africa”. 4th ed.
- AFNOR (2012) “NF P 94-262 – Justification des ouvrages géo-techniques, Normes d’application nationale de l’Eurocode 7”, Afnor, Paris, July 2012.
- Lehane, B. (2017) “CPT-Based Design of Foundations”. E.H Davis Memorial Lecture, Australian Geomechanics Vol 54. No. 4.
- Lehane, B. et al. (2020) “A New ‘Unified’ CPT-Based Axial Pile Capacity Design for Drivel Piles in Sand”. Proceedings of the Fourth International Symposium on Frontiers of Offshore Geotechnics.
- Doan., Lehane, B. (2021) “CPT-Based Design Method for Axial Capacities of Drilled Shafts and Cast-in-place Piles.” American Society of Civil Engineers (ASCE), Journal of Geotechnical and Geoenvironmental Engineering.

The pile designer must:

- consider the possible variation in subsurface conditions at each pile location;
- consider any pile group effects based on the final piling configuration;
- assume that the unit shaft resistance in tension is less than 80% of the unit shaft resistance in compression to account for Poisson’s effect in sand;
- ignore pile resistance in the surficial 0.5 m or 1 x pile diameter (whichever is greater), if relevant;
- consider the impact of weak layers underlying stiffer layers (or vice versa) on end bearing capacity; and
- reduce the pile capacity in tension to no greater than 0.8 of the pile capacity in compression.

The piling contractor must:

- make their own assessment on the suitability of their equipment to install any piles at the subject site; and
- carry out or appoint a suitably experienced contractor to test the piles in accordance with AS2159.

Where dynamic or static testing of the piles does not occur, we consider that a design geotechnical reduction factor (ϕg) of 0.4 is applicable for the pile design. If testing of the piles is proposed by the piling contractor, a higher ϕg could be adopted.

Unless otherwise stated, providing pile design parameters does not specifically indicate the driveability of any piles into soil units.

A separate driveability study may be required and must be considered by the pile designer and installer. The given pile design parameters must not be used for driveability assessments as these parameters are likely to be un-conservative.

GDR11 EARTH RETAINING STRUCTURES

GDR11.1 General

Retaining structures may be designed in accordance with AS4678 (2002) "Earth Retaining Structures". Unless otherwise specifically stated, we recommend that all retaining walls are backfilled with free-draining soil (Permeable Sand or Blue Metal Gravel as defined in Section GDR8).

Where the cohesive soil is used as retaining wall backfill, a suitable, permanent drainage system must be placed behind the wall such that a build-up of pore pressure is prevented. A separator geotextile (Bidim A24, or similar, or heavier) must be used between the interface of any granular backfill and the cohesive soil.

Where drainage is not provided, the retaining wall must be designed to accommodate water pressure behind the wall (10 kPa per metre height).

GDR11.2 Earth Pressure Coefficients and Strength Parameters

Where earth pressure coefficients are provided for retaining walls, the wall designer must make an independent assessment of the parameters appropriate to the construction method to be used, including alternative values of wall friction. Unless otherwise stated, we have assumed a horizontal ground surface behind and in front of the retaining wall for provided parameters.

GDR11.2.1 Cohesionless Soils

Where cross-referenced for suitability in the report, the following parameters may be adopted for design of earth retaining structures in cohesionless soils (sand and gravel).

Table GDR 17: Retaining Wall Geotechnical Parameters (Cohesionless Soils)

Density	γ (kN/m^3)	ϕ' (°)	k_0	Wall Friction=0		Wall Friction=0.5ϕ		Wall Friction=0.67ϕ	
				k_a	k_p	k_a	k_p	k_a	k_p
Very Loose	17	30	0.44	0.33	3.00	0.29	4.81	0.28	5.74
Loose	17	32	0.42	0.31	3.25	0.27	5.55	0.26	6.83
Medium Dense	18	34	0.39	0.28	3.54	0.25	6.47	0.23	8.26
Dense	19	36	0.36	0.26	3.85	0.22	7.63	0.21	10.18
Very Dense (1)	19	38	0.34	0.24	4.20	0.21	9.11	0.20	12.85
Very Dense (2)	19	40	0.31	0.22	4.60	0.19	11.06	0.18	16.73

NOTES:

1. *Earth pressure coefficients are provided in this table for conditions of zero friction between the wall and the soil and with wall friction of 0.5Φ' or 0.67Φ'.*
2. *A horizontal ground surface behind and in front of the wall has been assumed.*
3. *The retaining wall designer should make an independent assessment of the parameters appropriate to the construction method to be used, including alternative values of wall friction.*
4. *γ – bulk unit weight*
   ϕ' – effective friction angle
   k_a – coefficient of active earth pressure (Coulomb – AS4678-2002, Appendix E)
   k_p – coefficient of passive earth pressure (Coulomb – AS4678-2002, Appendix E)
   k_0 – coefficient of at-rest earth pressure (Jaky)
5. *Maximum fines content 12% for applicability of this table for design purposes.*
6. *Unit weights based on Table D1 of AS4678-2002, for moist bulk weight.*
7. *Friction angle based on Equation D1 and Table D2 of AS4678-2002, based on rounded, moderately graded siliceous sand.*

GDR11.2.2 Cohesive Soils

Where cohesive soils (i.e. clayey or silty soils) are proposed for backfill, geotechnical design parameters may be provided in the form of effective strength and undrained strength parameters. We note that:

- Undrained strength parameters should be used for analysis of short-term stability, or stability under sudden loading of cohesive soils.
- The effective strength parameters should be used for analysis of free-draining soils and the long-term stability of cohesive soils.

Table GDR 18: Retaining Wall Geotechnical Design Parameters (Cohesive Soils – Undrained)

Consistency	γ_b (kN/m^3)	c_u (kPa)

Soft	17	12
Firm	18	25
Stiff	19	50
Very Stiff	20	100
Hard	20	200

NOTES:
1. *γ_b – bulk unit weight*
   c_u – undrained cohesion
   $\phi_u = 0^o$ (undrained friction angle)
2. *Unit weights based on Table D1 of AS4678-2002*
3. *Undrained cohesion based on lower end of shear strengths as define in AS1726-2017, Table 11*

Table GDR 19: Retaining Wall Geotechnical Design Parameters (Cohesive Soils – Drained)

Fines Content	PI (%)	γ_b (kN/m^3)	ϕ' (°)	c' (kPa)[5]
12-35%	All	19	32	0
>35%	10	20	30	0 – 5
>35%	20	20	26	0 – 5
>35%	30	20	23	0 – 5
>35%	40	20	21	0 – 5

NOTES:
1. *γ_b – bulk unit weight*
   c' – drained cohesion
   ϕ' – effective friction angle
   PI – plasticity index
2. *Unit weights based on Table D1 of AS4678-2002, assuming generally stiff to hard overconsolidated soils.*
3. *For fines contents <35% (silty sand and clayey sand), strength parameters based on:*
   - *Lehane, B. et al (2007) "A Laboratory Investigation of the Upper Horizons of the Perth/Guildford Formation in Perth CBD", Australian Geomechanics Vol 42. No. 3.*
4. *For fines content >35% (sandy clay), strength parameters based on:*
   - *CIVL5503 course notes (2004), "Underground Construction", University of Western Australia*
5. *c' = 0 recommended for long-term design. Table D4 of AS4678 suggests c' up to 5 kPa for 'poor' fine grained soils and 10 kPa for 'average' fine-grained soils. The use of c' for design is subject to the designer's judgement but recommended by us only for temporary works.*

Per AS4678-2002 Appendix E, horizontal earth pressures for frictional-cohesive soils may be calculated in accordance with the Rankine-Bell design model (illustrated in Figure E2 of AS4678). The earth pressures are as follows (Z = depth, all other terms have the meanings given in the above tables):

- Active: $p_a = \gamma\ Z\ tan^2\left(45 - \frac{\emptyset}{2}\right) - 2\ c\ tan\left(45 - \frac{\emptyset}{2}\right)$
- Passive: $p_p = \gamma\ Z\ tan^2\left(45 + \frac{\emptyset}{2}\right) + 2\ c\ tan\left(45 + \frac{\emptyset}{2}\right)$

GDR11.3 Design and Construction Considerations

Compaction plant can augment the lateral earth pressure acting on retaining walls. Hand operated compaction equipment is recommended within 2 m of any retaining walls to minimise compaction pressures.

Retaining walls can move and rotate under imposed soil loading resulting in settlement behind the wall. This must be considered in the design and during construction of the retaining walls in order that adjacent infrastructure is not adversely affected.

It is important to note that some ground movement will occur behind any soil retaining system, including gravity retaining walls.

GDR12 EXCAVATIONS, BATTERS AND SLOPES

GDR12.1 Excavatability

Our assessment of the excavatability of rock is based on a combination of:

- Our experience on earthworks and construction projects across Australia; and

- Figure 10 of the revised graphical method of assessing excavatability of rock by:
- Pettifer, G.S. & Fookes, P.G., "A revision of the graphical method for assessing the excavatability of rock", Quarterly Journal of Engineering Geology, 27, pp145-164, 1994.

GDR12.2 Safety

All excavations must be carried out in accordance with:

- Commission for Occupational Safety and Health (2022). "Excavation: Code of Practice", Department of Mines, Industry Regulation and Safety, 89pp, Perth.

Excavations in cohesionless soils are particularly prone to instability unless support is provided. Care must be exercised in such excavations and appropriate safety measures adopted where necessary, particularly in the vicinity of existing buildings, structures and infrastructure.

The toe of any batter must be at least 500 mm above groundwater (including perched groundwater).

Unless a specific slope stability assessment or retention design has been done, the toe of any excavation should not encroach within a line of 1V:3H to any nearby footings, pavements or other settlement-sensitive structures.

Surcharges (such as structures, plant and soil stockpiles) must not be placed at or close to the crest of unsupported excavations, without a specific slope stability assessment.

A geotechnical engineer must be consulted where there is any doubt regarding the stability or safety of unsupported excavations.

GDR12.3 Batters

Temporary batter slopes provided in the report are subject to the following conditions, unless otherwise stated:

- The maximum slope height is 2 m without specific advice and slope stability analysis.
- The groundwater level for the duration of the excavation must be at least 500 mm below the toe of the slope.
- No surcharges are present in the vicinity of the slope (i.e. must be outside a line of 1V:3H from the toe of the slope).

Unless noted specifically in the report, the following batters may be adopted (maximum height: 2 m):

Table GDR 20: Default Batter Angles

Situation	Material	Batter
Temporary	Cohesionless Soils (Sand/Gravel)	1V:2H
Temporary	Cohesive Soils – Soft	1V:2H
Temporary	Cohesive Soils – Firm, Stiff, Very Stiff or Hard	1V:1H
Temporary	Limestone – Variably Cemented	1V:1H
Temporary	Limestone – Well Cemented	1V:0.5H
Permanent	All Soils	1V:3H
Permanent	Limestone – Variably Cemented	1V:2H
Permanent	Limestone – Well Cemented	1V:1H

Where specified batters cannot be accommodated in the vicinity of existing footings, roads and services, temporary or permanent lateral support will be required.

Specific advice is required for batters higher than 2 m.

Erosion control must be considered for permanent slopes.

Rock slopes must be inspected, and all loose cobbles / boulders removed. Permanent rock slopes may require dentition works or possibly rock catch drains.

GDR12.4 Grouting

Permeation or jet grouting involves injecting a microfine cement into soil to form a grouted soil block (soilcrete) to support excavation and structures. Grouting is typically only effective where the soil has the capacity to "take" the grout and form a uniformly cemented soil mass. Permeation grouting is generally limited to relatively permeable, coarse-grained cohesionless soils (sands and gravels with <5% fines).

If grouting is proposed, we recommend the following:

- Grouting must be carried out by a suitably experienced contractor.
- Only microfine cement grout should be used (not GP or coarse cement blends) to ensure adequate penetration into the soil matrix.
- Grouting should be done on a grid of not greater than 300 m.
- Application rates must be discussed with the contractor.
- The grouted soil mass must have intimate contact with any structures it is intended to support.
- The contractor must satisfy themselves that the proposed grouting can be installed with their equipment and into the subsurface conditions encountered at the site, considering possible obstructions, groundwater, cemented layers, loose sands etc.
- Testing of the grouted soil mass must be done to ensure that the grout has adequately permeated through the soil matrix. This can be done by drilling into the soil mass to ensure the cementation is continuous.

Grouting is most effective on permeable, relatively loose natural sand. Where historical filling or other ground disturbances have occurred, the grouting process can be less effective due to the tendency of grout (or other liquids) to follow more permeable paths / zones through the disturbed soil.

GDR13 STORMWATER DISPOSAL AND DRAINAGE DESIGN

GDR13.1 Groundwater Separation – Controlled Groundwater

These recommendations ONLY apply to where regional controls on groundwater (primarily: subsoil drainage, but also surficial 'main drains') exist, i.e. only to areas where groundwater is actively controlled.

The following reference:

- IPWEA (2016), "Specification: Separation Distances for Groundwater Controlled Urban Development", Institute of Public Works Engineering Australasia

recommends the following separation distances from drainage infrastructure to groundwater:

- Underground infiltration systems: 0 mm from the 50% AEP (annual exceedance probability) phreatic surface.
- Surface infiltration systems (vegetated): 300 mm from the 50% AEP phreatic surface.

The above IPWEA reference also states that performance measures for underground infiltration systems are to have a: demonstration of acceptable volumetric capacity when groundwater is elevated above base of system and that the groundwater recedes below the invert of the system during mosquito breeding seasons (grated or partially open systems).

GDR13.2 Groundwater Separation – Uncontrolled Groundwater

These recommendations apply where regional controls on groundwater levels are not present. For infiltration into soakwells and soakage basins to be the full theoretical value, an adequate separation to groundwater must be achieved, because otherwise performance is hindered by inadequate separation to groundwater or partial submergence of the infiltrative element.

We recommend a minimum separation of 500 mm from the underside of infiltrative elements to maximum groundwater level.

- To average annual maximum groundwater level (AAMGL), where this has been defined for the site; or
- To historical maximum groundwater level, where this has been defined to the site.

GDR13.3 Design Hydraulic Conductivity Values

Where provided, the values of hydraulic conductivity (k) should be considered the maximum/upper limit design values. As discussed in Section GDR3.7, the inverse auger hole test is an unsaturated field test carried out above the groundwater table and, as such, presents the best-case conditions for drainage.

For soak wells in sand, we provide the design value taking into consideration the variability in materials and reduced permeability as a result of:

- Densification of sand during site preparation works; and
- Natural variation in sands.

Design k_{unsat} values provided for soak wells are only appropriate for the design of unsaturated soils where the base of disposal area is at least 500 mm above groundwater and 500 mm above any impermeable layer.

Where design values of k_{unsat} have been provided, clogging of the base of the soakwell / drainage basin has not been considered. Clogging will need to be controlled with maintenance over the life of the soakwell / drainage basin.

For the design of subsoil drains or modelling of saturated soil performance, a k_{sat} value must be given (in the report text) or assessed by laboratory testing (or a combination of field and laboratory testing). Unless specifically stated, k_{unsat} values presented in our report are for unsaturated conditions and intended for design of stormwater disposal elements above groundwater. If no k_{sat} value has been provided, do not use the provided k_{unsat} value for saturated drainage design. Please contact us for further advice.

For saturated or semi-saturated sands, the hydraulic conductivity must be assessed by testing of representative soil samples at a NATA accredited laboratory to determine:

- The modified maximum dry density (MMDD); and
- The constant-head permeability (AS1289.6.7.1) on a sample remoulded to at least 5% greater than the proposed specification density (i.e., sample should be remoulded to 100% MMDD if the earthworks specification requires a density ratio of 95% MMDD).

For saturated or semi-saturated clayey or silty soils, the hydraulic conductivity must be assessed by testing of representative soil samples at a NATA accredited laboratory to determine:

- The standard maximum dry density (SMDD); and
- The falling-head permeability (AS1289.6.7.2) on a sample remoulded to at least 3% greater than the proposed specification density (i.e., sample should be remoulded to 101% SMDD if the earthworks specification requires a density ratio of 98% SMDD).

GDR13.4 Soakwells

In uncontrolled groundwater environments, the base of any soakwell must be the higher of:

- At least 500 mm above the average annual maximum groundwater level (AAMGL).
- At least 500 mm above any low permeability/impermeable layers (clay, rock or otherwise).

In controlled groundwater environments (refer to Section GDR13.1), the base of any soakwell may be 0 mm above the controlled groundwater level at the location of the soakwell (as determined by the civil engineer).

Soak wells must be placed outside a line of 1V:2H extending below the edge of the nearest footing, subject to local council regulations. Discharge from soak wells has been known to promote densification of loose sandy soils, leading to settlements of footings and slabs. Soak wells should be carefully wrapped with geotextile to prevent migration of sand and fines into the soak well.

Where soak wells are proposed to dispose of water within a line of 1V:2H from any basement walls or similar, the walls must be waterproofed to prevent seepage or damp within the basement wall.

In potentially karstic terrain or areas of potentially collapsible soils, soakwells should typically be located 10 m from the nearest footing, slab or pavement.

GDR13.5 Design Groundwater Elevation

Where applicable, a recommended design groundwater elevation will be provided in the report and will be identified as such.

In the absence of a specific statement on design groundwater elevation, do not assume that:

- Absence of comments about groundwater indicates an absence of groundwater (in particular, sites that are dry in the dry season to the investigated depth may well become waterlogged in the rainy season).
- Where groundwater depths/levels are noted, that these are fixed (groundwater fluctuations occur over the course of the year and between wetter and drier years).

Where groundwater elevations are likely to be critical for a development (particularly where large-scale subdivision or large developments are proposed with substantial channelling of stormwater into on-site disposal by infiltration), a site-specific hydrology study is likely to be required to confirm design groundwater elevations.

GDR14 DRAINAGE CONTROL

In addition to the site preparation measures outlined for cohesive soils (refer Section GDR6.2.4), careful control of surface water and stormwater is essential to minimise the likelihood of cohesive soils decreasing in strength and affecting the installed infrastructure. These measures include:

- The ground surface of clayey soils should be graded to drain any seepage away from structures and prevent standing water over the cohesive soils. A grade of at least 1% is recommended.
- Pavements should be sealed to minimise water ingress.
- Stormwater disposal swales should be located at least 10 m away from buildings, retaining walls and pavements.
- Runoff from hardstandings and pavements must either be collected and discharged via pipes into discrete locations (via swales or soakage basins) at least 10 m away from structures and pavements or, alternatively, discharged over a wide area, but not allowed to collect and discharge into concentrated areas, particularly near structures and pavements.
- Spoon drains should be used to collect water at the crest of slopes to capture surface runoff and direct it away from running directly down slopes or seeping into the ground behind slopes.

These measures are general in nature only and do not take into account the civil design objectives, which must be addressed separately by the civil designer.

GDR15 DEWATERING

Dewatering may be required for excavations and construction below groundwater or perched groundwater tables. Common dewatering methods are summarised below:

Table GDR 21: Dewatering Recommendations

Material	Recommended Methods
Sandy Soils	Spears Deep Well Point
Impermeable Clay	Sump Pumping

Dewatering spears are typically suitable for small scale excavations below groundwater, with a typical recommendation for spears to be installed at 1 m below the base of any excavation. Dewatering spears may not be suitable where there are impermeable/cemented/strong transition layers, i.e., it may not be possible to extract water near an impermeable layer (rock/clay), or the spear may not be readily driven through a hard clay/cemented layer (i.e., coffee rock).

Sump pumping can be done by grading a clayey excavation to drain (i.e., by using spoon drains), and excavating a sump in the excavation. A sump can typically be backfilled with a blue metal gravel, with a pump wrapped in a geofabric (i.e., Bidim A14 or similar), with disposal of water away from the excavation.

Deep well point dewatering is typically suitable for larger excavations, where there are transitional layers or where the aquifer is confined. It may not be suitable where there are impermeable layers within the profile. It involves the installation of a deep filtered well to a depth required to draw down the groundwater level at the entire site. A deep well dewatering system must be designed by a suitable designer to provide design flow rates, draw down depths etc.

GDR16 PAVEMENT SUBGRADES

Unless otherwise specified, the provided subgrade California bearing ratio (CBR) is not a pavement design, but an assessment of the subgrade as an input into any required pavement designs.

Provided design values are based on the assumption that the relevant site preparation measures are completed for all pavement subgrades, including the use of appropriate approved fill and adequate compaction. We highlight that specific requirements such as those outlined by Main Roads WA (MRWA) or the local council in their construction specifications may have different requirements.

The provided design value is based on laboratory testing (where done), local experience, and the advice as outlined in:

- Main Roads Western Australia (2013). “Engineering Road Note 9 – Procedure for the Design of Road Pavements”. Western Australia Supplement to the Austroads Guide to Pavement Technology Part 2: Pavement Structural Design, East Perth.

Where the subgrade differs from that described in the text, the subgrade CBR must be confirmed.

The performance of any pavement is highly dependent on the surface and subsurface drainage provided (also considering factors like capillary rise from seasonally high groundwater tables). Adequate drainage must be provided to any pavements, and capillary rise must be considered by the designer.

GDR17 SOIL CORROSIVITY AND AGGRESSIVITY

The relevant exposure classifications for concrete and steel piles in soils based on the exposure conditions are presented in Table GDR 22 and Table GDR 23 respectively.

The relevant exposure classifications for concrete in sulfate soils based on the exposure conditions are presented in Table GDR 24.

Table GDR 22: Exposure Classification for Concrete Piles in Soil

Exposure Conditions				Exposure Classification	
Sulfates (expressed as SO_4)[1]					
In Soil (ppm)	In Groundwater (ppm)	pH	Chlorides in Groundwater (ppm)	Soil Conditions A[2]	Soil Conditions B[3]
< 5,000	< 1,000	> 5.5	<6000	Mild	Non-aggressive
5,000 – 10,000	1,000 – 3,000	4.5 – 5.5	6,000-12,000	Moderate	Mild
10, 000 – 20,000	3,000 – 10,000	4 – 4.5	12,000-30,000	Severe	Moderate
> 20,000	> 10,000	< 4	>30,000	Very Severe	Severe

NOTES:
1. *Approximately 100 ppm SO_4 = 80 ppm SO_3*
2. *Soil Conditions A – high permeability soils (e.g. sands and gravels) which are in groundwater*
3. *Soil Conditions B – low permeability soils (e.g. silts and clays) or all soils above groundwater*
4. *Table reproduced from Table 6.4.2(C) of AS2159-2009*

Table GDR 23: Exposure Classification for Steel Piles in Soil

pH	Chlorides		Resistivity (ohm.cm)	Exposure Classification	
	In Soil (ppm)	In Water (ppm)		Soil Conditions A[2]	Soil Conditions B[3]
> 5	< 5,000	< 1,000	> 5,000	Non-aggressive	Non-aggressive
4–5	5,000-20,000	1,000–10,000	2,000 – 5,000	Mildly aggressive	Non-aggressive
3–4	20,000-50,000	10,000–20,000	1,000 – 2,000	Moderately aggressive	Mildly aggressive
< 3	> 50,000	> 20,000	< 1,000	Severely aggressive	Moderately aggressive

NOTES:
1. *1 ppm (parts per million) is equivalent to 1 mg/kg*
2. *Soil Conditions A – high permeability soils (e.g. sands and gravels) which are in groundwater*
3. *Soil Conditions B – low permeability soils (e.g. silts and clays) or all soils above groundwater*
4. *Table reproduced from Table 6.5.2(C) of AS2159-2009*

Table GDR 24: Exposure Classification for Concrete in Sulfate Soils

Exposure Conditions			Exposure Classification	
Sulfates (expressed as SO_4)[1]				
In Soil (ppm)	In Groundwater (ppm)	pH	Soil Conditions A[2]	Soil Conditions B[3]
< 5,000	< 1,000	> 5.5	Mild	Non-aggressive
5,000 – 10,000	1,000 – 3,000	4.5 – 5.5	Moderate	Mild
10, 000 – 20,000	3,000 – 10,000	4 – 4.5	Severe	Moderate
> 20,000	> 10,000	< 4	Very Severe	Severe

NOTES:
1. *Approximately 100 ppm SO_4 = 80 ppm SO_3*
2. *Soil Conditions A – high permeability soils (e.g. sands and gravels) which are in groundwater*
3. *Soil Conditions B – low permeability soils (e.g. silts and clays) or all soils above groundwater*
4. *For disturbed soils, the assumption of soil A conditions where accelerated corrosion is possible should be considered.*
5. *Table reproduced from Table 4.8.1 of AS3600-2018*

GDR18 LIQUEFACTION

Soil liquefaction can occur when loose, granular, Holocene age material below the groundwater table is subjected to a seismic event (typically within 15 m of the ground surface). This can cause a loss of strength and result in vertical and lateral movements of the site surface.

Where a liquefaction analysis is carried out and outlined in the report, this has been done in accordance with consideration to the design earthquake details as presented in AS1170.4-2007:

- The hazard factor is taken from Figure 3.2 (C) and Table 3.2. The Hazard Factor (Z) for Western Australia represents the 1 in 500-year annual probability of exceedance of ground motions measured in gravity (g).
- The probability factor (k_p) is taken from Table 3.1.

Unless otherwise stated, an earthquake magnitude of 7.5 for the south-west of WA is based on research by:

- Dhu T., Sinadinovski C., Edwards M., Robinson D., Jones T., Jones A. (2004) “Earthquake Risk Assessment for Perth, Western Australia”. 13th World Conference on Earthquake Engineering, Vancouver, B.C., Canada. Paper No. 2748.

GDR19 EXPECTATIONS OF THE REPORT

The following sections have been prepared to clarify what is and is not provided in your report. It is intended to inform you of what your realistic expectations of this report should be and how to manage your risks associated with the conditions on site.

Geotechnical engineering and environmental science are less exact than other engineering and scientific disciplines. We include this information to help you understand where our responsibilities begin and end. You should read and understand this information. Please contact us if you do not understand the report or this explanation. We have extensive experience in a wide variety of projects and we can help you to manage your risk.

GDR20 THIS REPORT RELATES TO PROJECT-SPECIFIC CONDITIONS

This report was developed for a unique set of project-specific conditions to meet the needs of the nominated client. It took into account the following:

- the project objectives as we understood them and as described in this report;
- the specific site mentioned in this report; and
- the current and proposed development at the site.

It should not be used for any purpose other than that indicated in the report. You should not rely on this report if any of the following conditions apply:

- the report was not written for you;
- the report was not written for the site specific to your development;
- the report was not written for your project (including a development at the correct site but other than that listed in the report); or
- the report was written before significant changes occurred at the site (such as a development or a change in ground conditions).

You should always inform us of changes in the proposed project (including minor changes) and request an assessment of their impact.

Where we are not informed of developments relevant to your report, we cannot be held responsible or liable for problems that may arise as a consequence.

Where design is to be carried out by others using information provided by us, we recommend that we be involved in the design process by being engaged for consultation with other members of the project team. Furthermore, we recommend that we be able to review work produced by other members of the project team that relies on information provided in our report.

GDR21 DATA PROVIDED BY THIRD PARTIES

Where data is provided by third parties, it will be identified as such in our reports. We necessarily rely on the completeness and accuracy of data provided by third parties in order to draw conclusions presented in our reports. We are not responsible for omissions, incomplete or inaccurate data associated with third party data, including where we have been requested to provide advice in relation to field investigation data provided by third parties.

GDR22 SOIL LOGS

Our reports often include logs of intrusive and non-intrusive investigation techniques prepared by Galt. These logs are based on our interpretation of field data and laboratory results. The logs should only be read in conjunction with the report they were issued with and should not be re-drawn for inclusion in other documents not prepared by us.

GDR23 THIRD PARTY RELIANCE

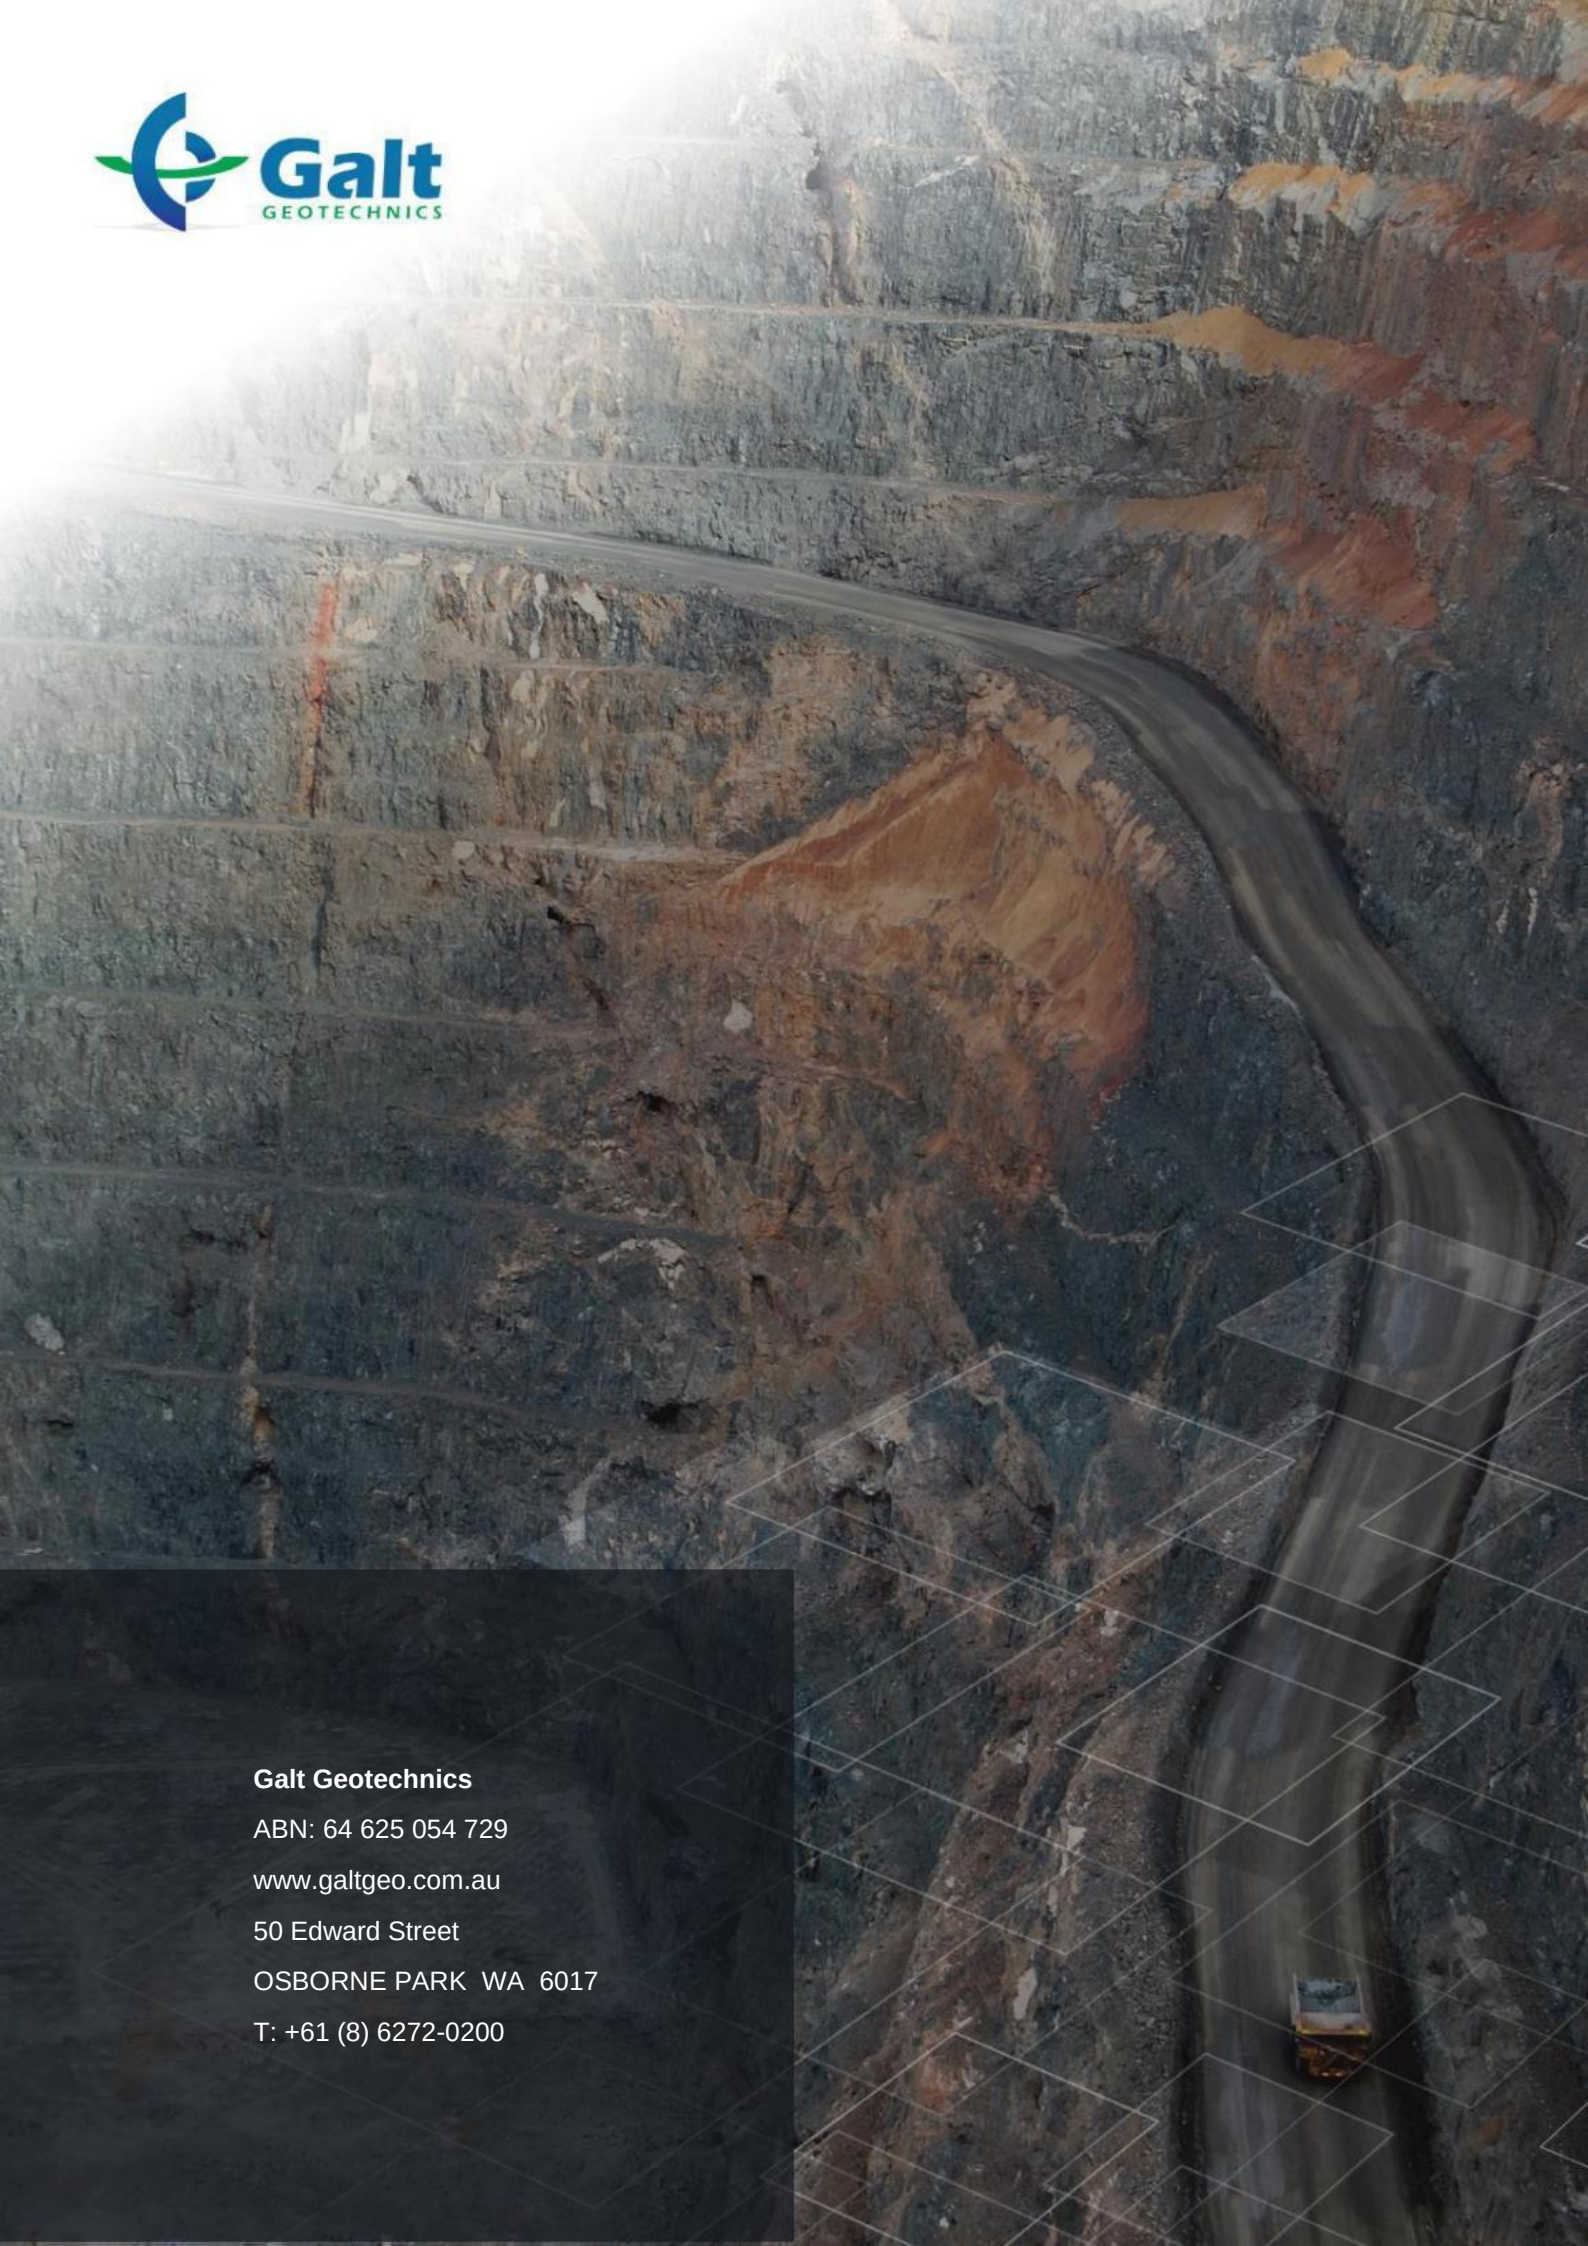
We have prepared this report for use by the client. This report must be regarded as confidential to the client and the client's professional advisors. We do not accept any responsibility for contents of this document from any party other than the nominated client. We take no responsibility for any damages suffered by a third party because of any decisions or actions they may make based on this report. Any reliance or decisions made by a third party based on this report are the responsibility of the third party and not of us.

GDR24 CHANGE IN SUBSURFACE CONDITIONS

The recommendations in this report are based on the ground conditions that existed at the time when the study was undertaken. Changes in ground conditions can occur in numerous ways including anthropogenic events (such as construction or contaminating activities on or adjacent to the site) or natural events (such as floods, groundwater fluctuations or earthquakes). We should be consulted prior to use of this report so that we can comment on its reliability. It is important to note that where ground conditions have changed, additional sampling, testing or analysis may be required to fully assess the changed conditions.

GDR25 SUBSURFACE CONDITIONS DURING CONSTRUCTION

Practical constraints mean that we cannot know every minute detail about the subsurface conditions at a particular site. We use professional judgement to form an opinion about the subsurface conditions at the site. Some variation to our evaluated conditions is likely and significant variation is possible. Accordingly, our report should not be considered as final as it is developed from professional judgement and opinion.

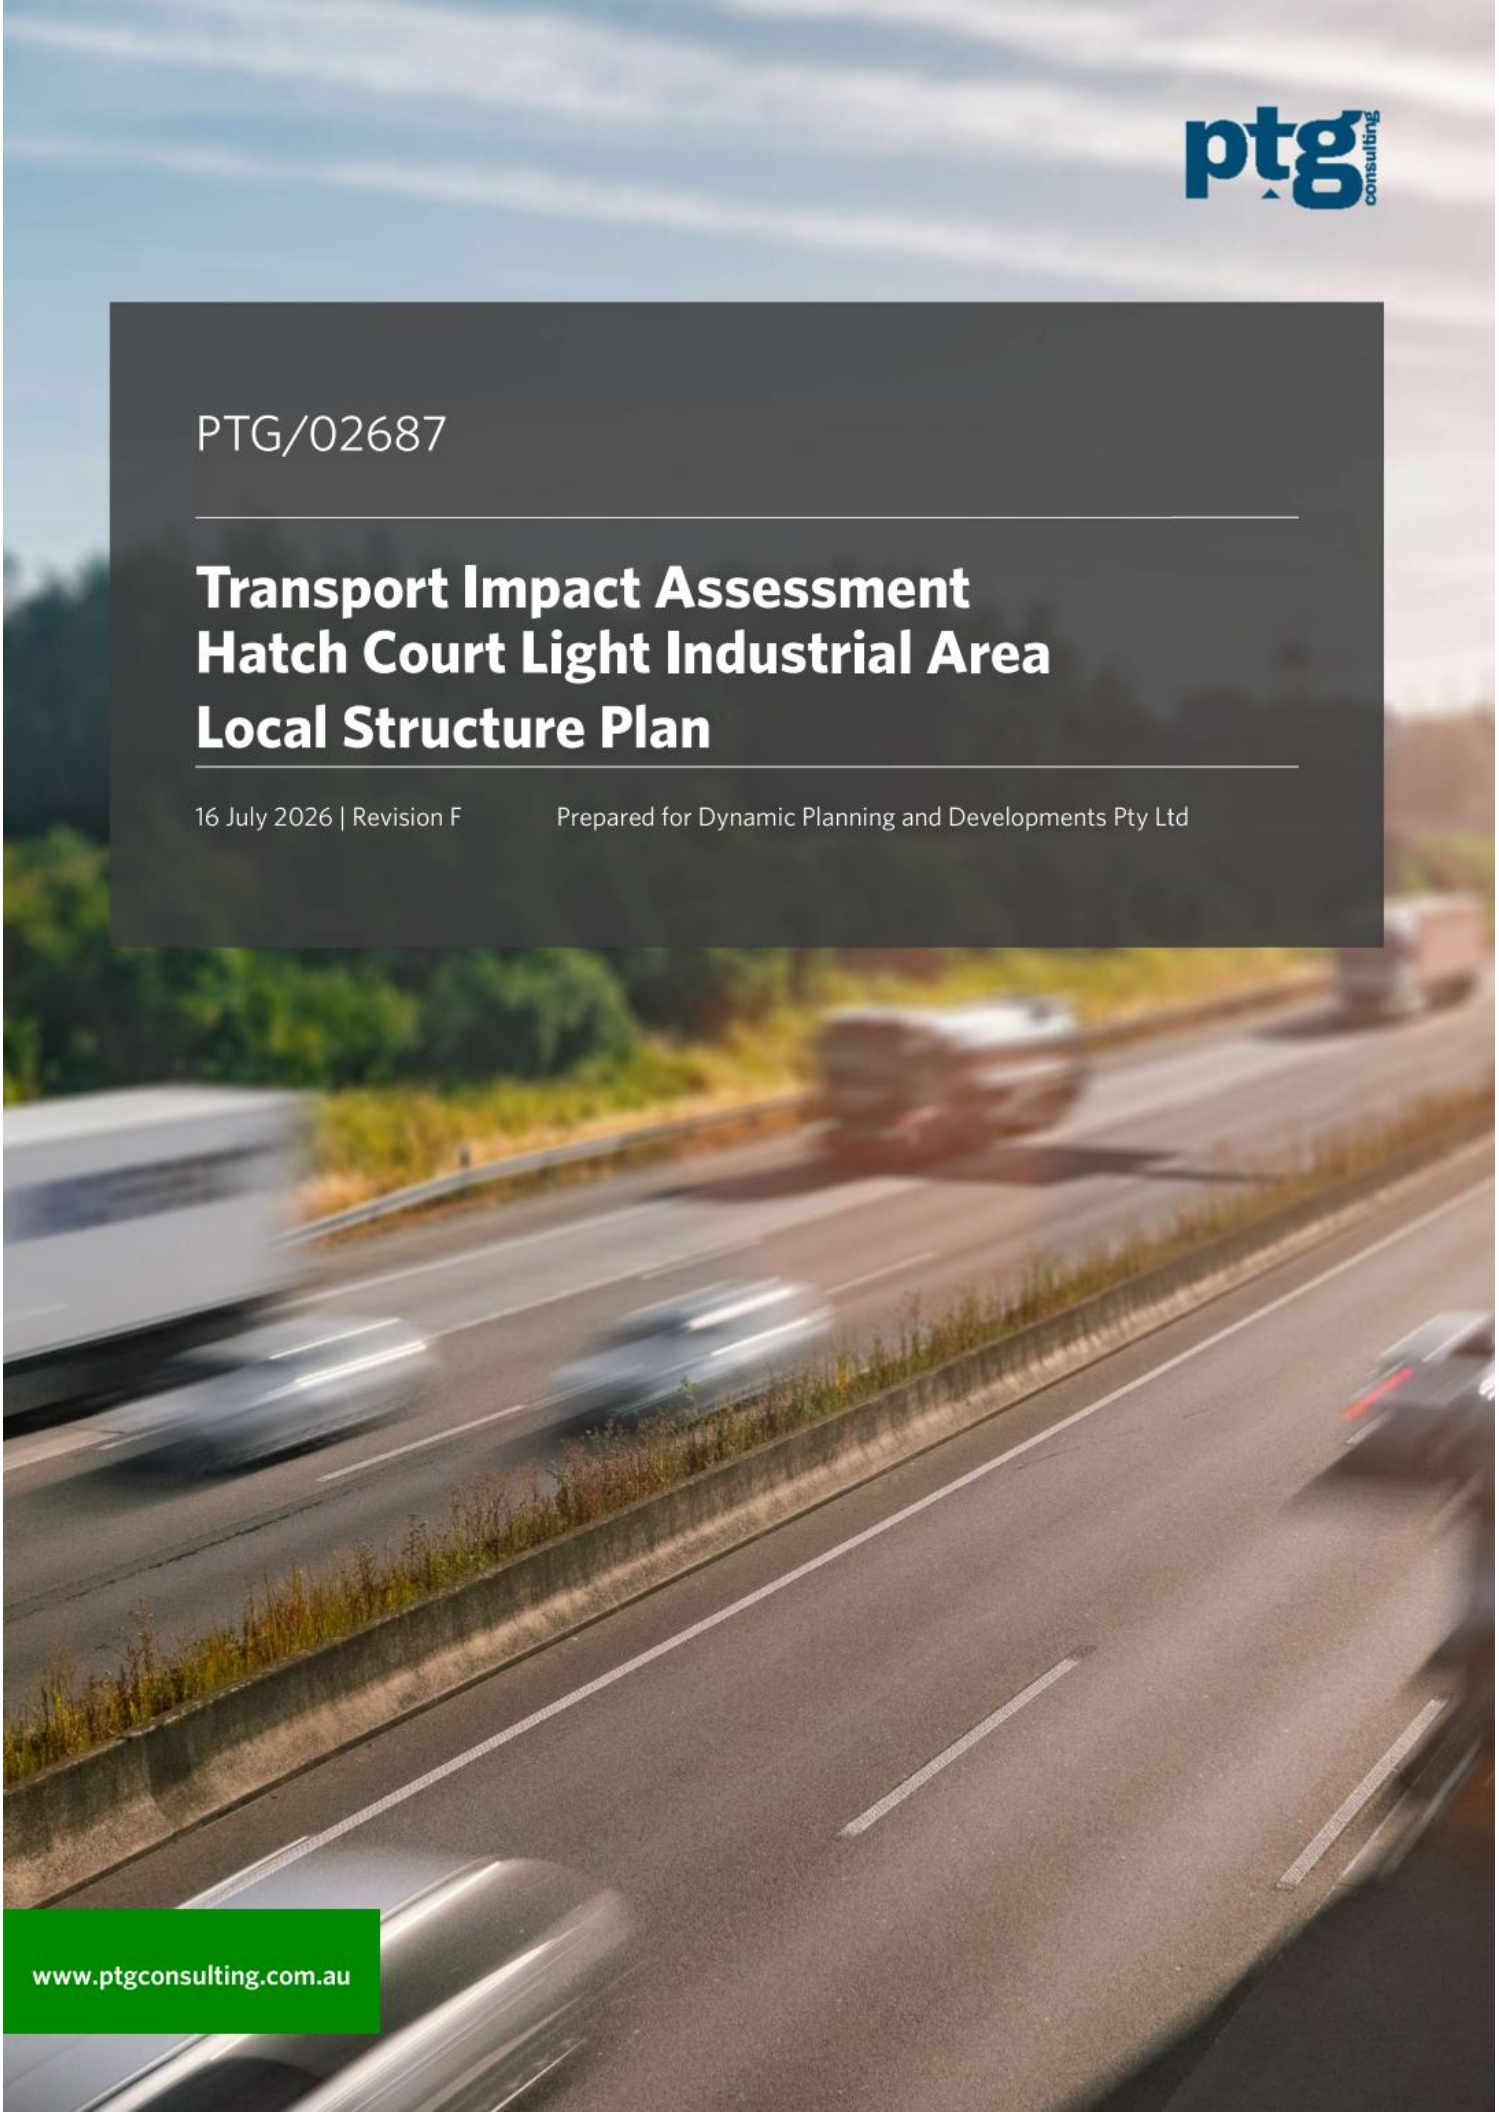


The most effective means of dealing with unanticipated ground conditions is to engage us for construction support. We can only finalise our recommendations by observing actual subsurface conditions encountered during construction. We cannot accept liability for a report's recommendations if we cannot observe construction.

GDR26 ENVIRONMENTAL AND GEOTECHNICAL ISSUES

Unless specifically mentioned otherwise in our report, environmental considerations are not addressed in geotechnical reports. Similarly, geotechnical issues are not addressed in environmental reports. The investigation techniques used for geotechnical investigations can differ from those used for environmental investigations. It is the client's responsibility to satisfy themselves that geotechnical and environmental considerations have been taken into account for the site.

Geotechnical advice presented in a Galt Environmental report has been provided by Galt Geotechnics under a sub-contract agreement. Similarly, environmental advice presented in a Galt Geotechnics report has been provided by Galt Environmental under a sub-contract agreement.



Unless specifically noted otherwise, no parties shall draw any inferences about the applicability of the Western Australian state government landfill levy from the contents of this document.

1 INTRODUCTION

1.1 Background

PTG Consulting Pty Ltd (PTG) has been commissioned by Dynamic Planning and Developments Pty Ltd to prepare a Transport Impact Assessment (TIA) for the proposed Hatch Court Local Structure Plan (LSP) located at Lots 51, 9, 15,19, 23, 27, 29, 30, 26, 24, 14 Hatch Court, Lots 20, 26, 30, 34, 38, 42, 46, 50, 54, 58, 62, 29, 37, 51 Stirling Crescent, and Lots 584 and 614 Kalamunda Road in High Wycombe in the City of Kalamunda, WA ("the Site").

This report has been prepared in accordance with the *Western Australian Planning Commission (WAPC) Transport Assessment Guidelines for Developments: Volume 2 – Planning Schemes, Structure Plans and Activity Centre Plans (2016) and the Transport Impact Assessment* (TIA) Checklist is included at Appendix A – WAPC Checklist.

Specifically, this report aims to assess the operations of the proposed Local Structure Plan (LSP) internally and its connections to the adjacent road network, with a focus on traffic volumes, access and accessibility.

This report also outlines the requirements and opportunities associated with traffic and transport within the development, referencing relevant Council and WAPC policies and guidelines as well as best-practice planning within Western Australia.

2 STRUCTURE PLAN PROPOSAL

2.1 Regional Context

The Site is located approximately 3km north of the Maddington Kenwick Strategic Employment Area, 500m from the Hazelmere Industrial Area, 3km northeast of Perth Airport, and 4km from the High Wycombe Train Station, as shown in **Figure 1**.

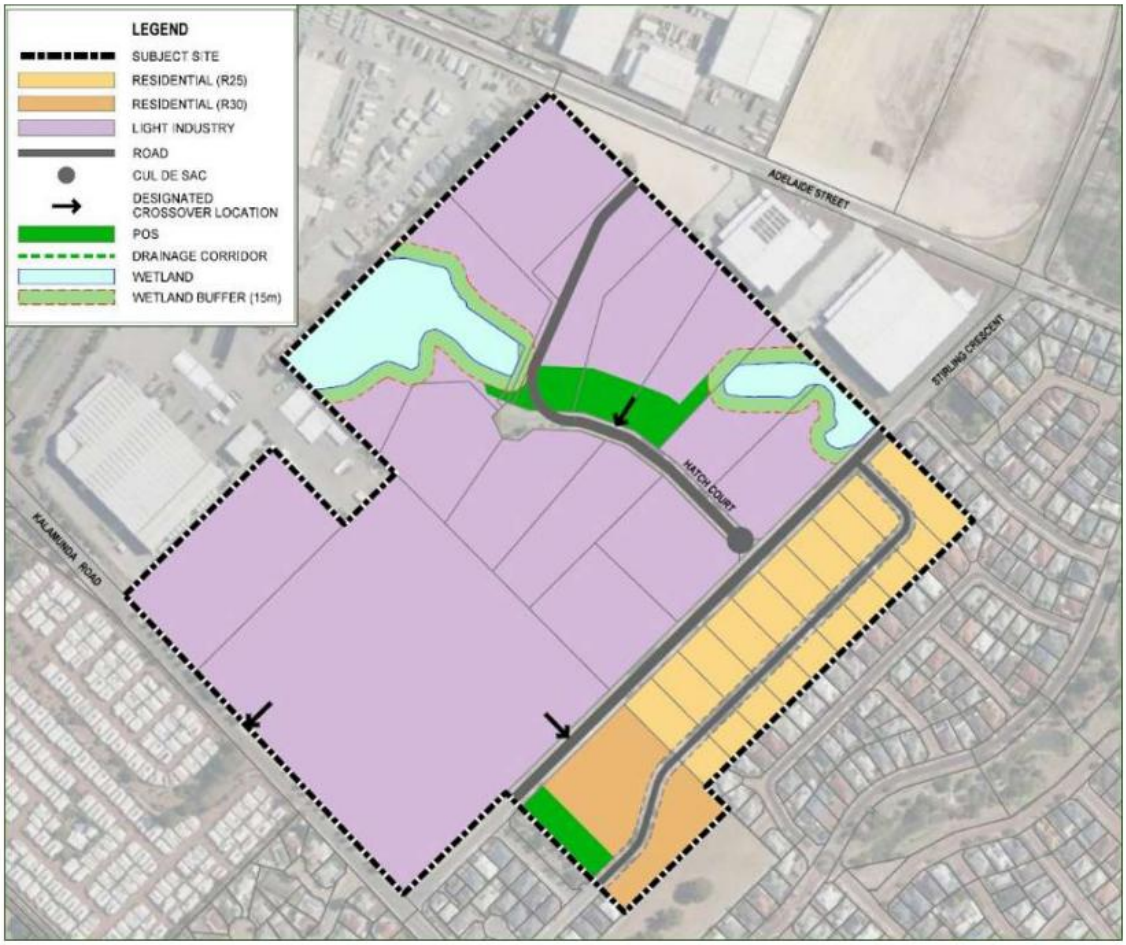
Figure 1 Site Location Context

Source: Landgate (2026)

2.2 Site Location

The Site is located at Lots 51, 9, 15,19, 23, 27, 29, 30, 26, 24, 14 Hatch Court, Lots 20, 26, 30, 34, 38, 42, 46, 50, 54, 58, 62, 29, 37, 51 Stirling Crescent, and Lots 584 and 614 Kalamunda Road, High Wycombe, WA. **Figure 2** shows the location of the proposed structure plan area.

Figure 2 Site Location



Source: Metromap (2026)

2.3 Proposed Land Uses

The development concept plan is illustrated in **Figure 3**.

Figure 3 Proposed Local Structure Plan Area

Source: Dynamic Planning and Developments Pty Ltd (June 2026)

2.4 Table of Land Uses and Quantities

The proposed land uses and yields are shown in **Table 1**. It is noted that existing road reserves are not included in the values presented below.

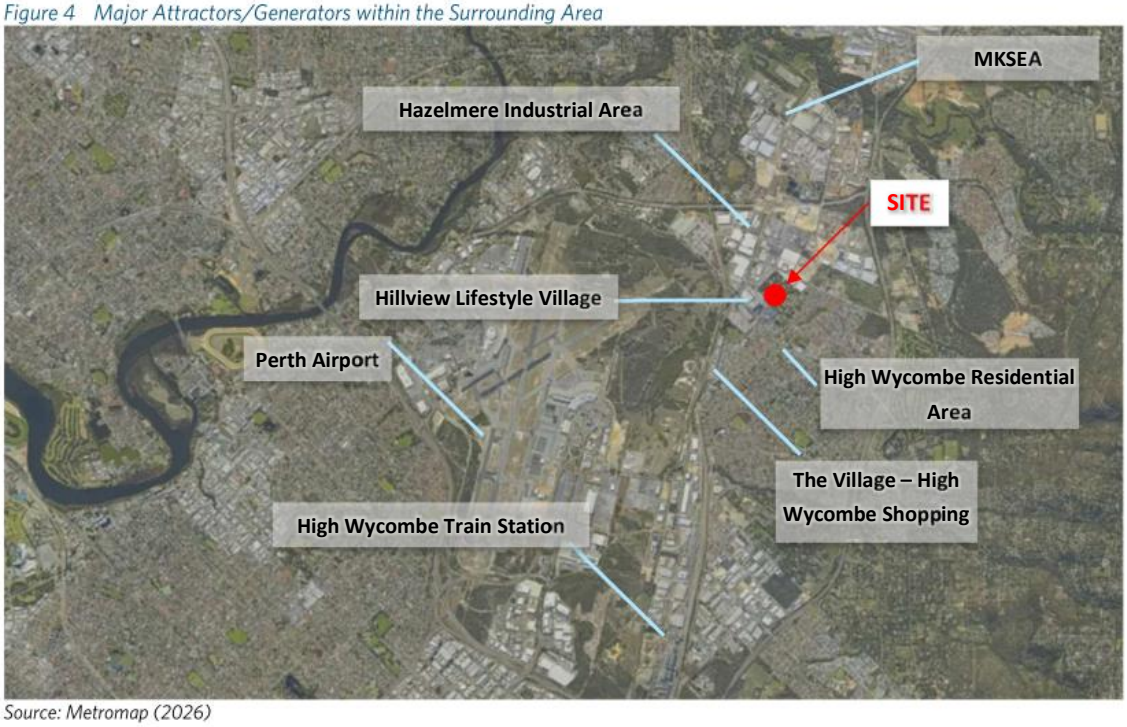


Table 1 Proposed Land Uses

Proposed Land Uses	Yield
Light Industrial	21.5700 ha
Residential	4.9126 ha (estimated yield of 140 residential lots)
New Road Reserves	1.4088 ha
Public Open Space/Drainage	0.2900 ha
Wetlands and Buffer	3.0591 ha
Wetlands and Buffer	0.6415 ha
Total Structure Plan Area	**31.8820 ha**

2.5 Major Attractors/Generators

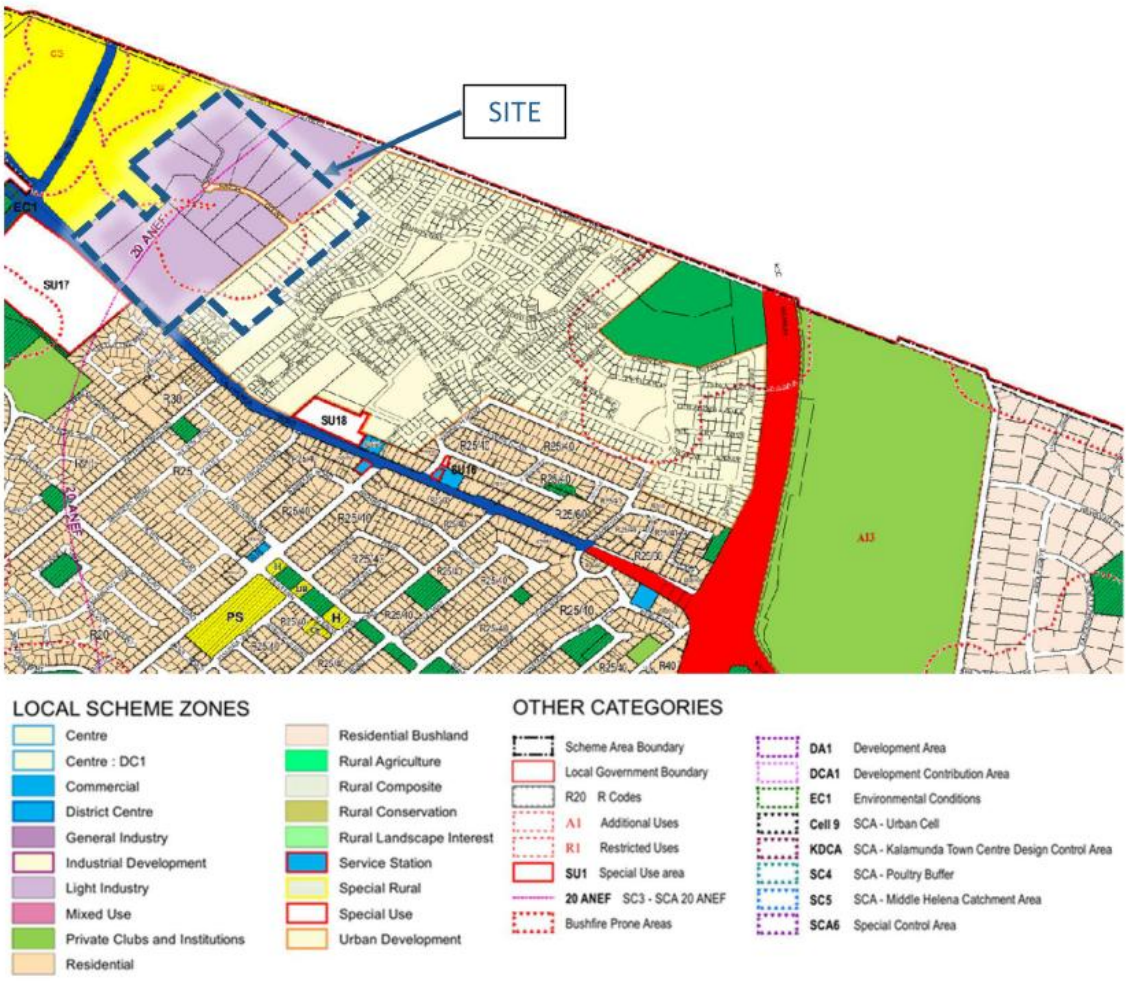
Major attractors and generators within the area surrounding the Site are shown in Figure 4.

Figure 4 Major Attractors/Generators within the Surrounding Area

Source: Metromap (2026)

2.6 Specific Issues

Due to the significant traffic volume, other regional road status and existing residential developments fronting Kalamunda Road adjacent to the LSP site, access directly from the Kalamunda Road frontage of the industrial lots is to be limited to a single crossover, proposed to remain as currently located. According to WAPC Development Control Policy 5.1, where alternative access is or could be made available from side or rear streets or from rights of way, no access shall be permitted to the regional road unless special circumstances apply.



Similarly with Stirling Crescent, no additional crossover access to industrial sites is to be permitted under the LSP for future developments due to the desire to retain as much "residential amenity" for the Stirling Crescent road environment as practicable.

3 EXISTING SITUATION

3.1 Existing Land Uses within 800m of Structure Plan Area

Pursuant to the *City of Kalamunda Local Planning Scheme No. 3* (LPS3), the Site is predominately zoned '*Light Industry*' with a portion zoned '*Urban Development*', as shown in **Figure 5**. The Site is surrounded by other light industry land uses to the north-east, urban development land uses to the east/south-east and residential land uses to the south.

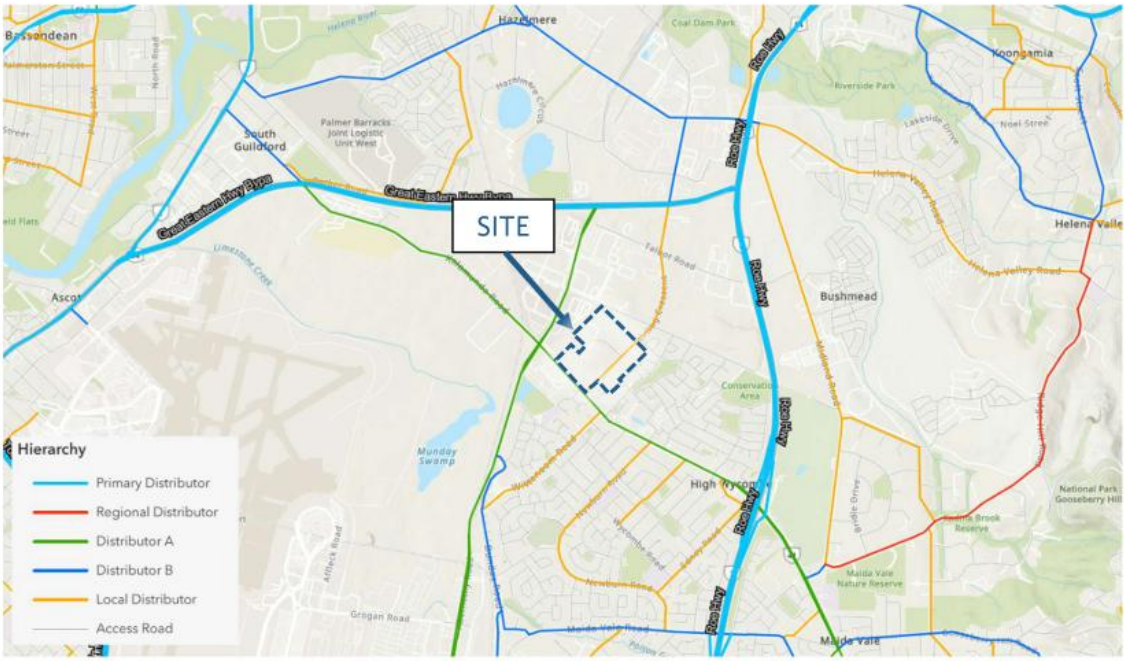
3.2 Existing Road Network within 2 (or 5) km of Structure Plan



The road network within Western Australia is defined by Main Roads WA Road Hierarchy which describes the function, characteristic and management of each type of road. A description of each road type as per Main Roads WA Road Hierarchy criteria is summarised in **Table 2**.

Table 2 Road Hierarchy Description

Road Type	Description
Primary Distributors	Provide for major regional and inter-regional traffic movement and carry large volumes of generally fast-moving traffic. Some are strategic freight routes, and all are State Roads. They are managed by Main Roads Western Australia.
District Distributor A	Carry traffic between industrial, commercial and residential areas and generally connect to Primary Distributors. These are likely to be truck routes and provide only limited access to adjoining property. They are managed by local government.
District Distributor B	Perform a similar function to type A District Distributors but with reduced capacity due to flow restrictions from access to and roadside parking alongside adjoining property. These are often older roads with a traffic demand in excess of that originally intended. District Distributor A and B roads run between land-use cells and generally not through them, forming a grid which would ideally space them around 1.5 kilometres apart. They are managed by local government.
Regional Distributor	Roads that are not Primary Distributors, but which link significant destinations and are designed for efficient movement of people and goods within and beyond regional areas. They are managed by local government.
Local Distributor (Urban)	Roads that carry traffic within a cell and link District Distributors or Regional Distributors at the boundary, to access roads. The route of Local Distributors should discourage through traffic so that the cell formed by the grid of District Distributors only carries traffic belonging to or serving the area. These roads should accommodate buses but discourage trucks. Urban Local Distributor roads are managed by local government.
Local Distributor (Rural)	Connect to other Rural Distributors and to Rural Access Roads. Not Regional Distributors, but which are designed for efficient movement of people and goods within regional areas. Rural Local Distributor roads are managed by local government.
Access Roads	Provide access to abutting properties with amenity, safety and aesthetic aspects having priority over the vehicle movement function. These roads are bicycle and pedestrian friendly. They are managed by local government.

Figure 7 shows the road hierarchy network and **Table 3** provides a summary of the road characteristics of the surrounding road network.

Figure 7 Existing Road Hierarchy

Source: MRWA Road Information Mapping System

Table 3 Existing Road Network

Road Name	Hierarchy	Jurisdiction	No. of Lanes	No. of Paths	Approximate Pavement Width (m)	Speed Limit (km/h)
Great Eastern Highway Bypass	Primary Distributor	MRWA	4 – 6	-	26	70 / 100
Roe Highway	Primary Distributor	MRWA	4 – 6	-	30	70 / 100
Kalamunda Road	Distributor A	LGA	2 – 4	1	7.5 - 18	60
Abernethy Road	Distributor A	LGA	2 – 4	-	10 - 26	60
Stirling Crescent	Local Distributor	LGA	2	1	7.5	60
Adelaide Street	Access Road	LGA	2	1	7.5	50
Hatch Court	Access Road	LGA	2	-	7	50
Peak Court	Access Road	LGA	2	-	10	50

3.3 Existing Pedestrian/Cycle Networks within Existing Structure Plan Area

The LSP area has no other existing roads with any existing pedestrian/cycle networks.

3.4 Existing Pedestrian/Cycle Networks within 800m of Structure Plan Area

Ther is a 2.4m-wide footpath provided along one side of Adelaide Street, Stirling Crescent and Kalamunda Road. In addition, there is also a 1.8m-wide footpath along Wem Mews and Acton Link.

Sealed Shoulders are provided along both sides of Kalamunda Road which connect the Site to Roe Highway and Great Eastern Highway, and both sides of portions of Abernethy Road as shown in **Figure 8**. As per the LTCN, these routes require significant improvements.

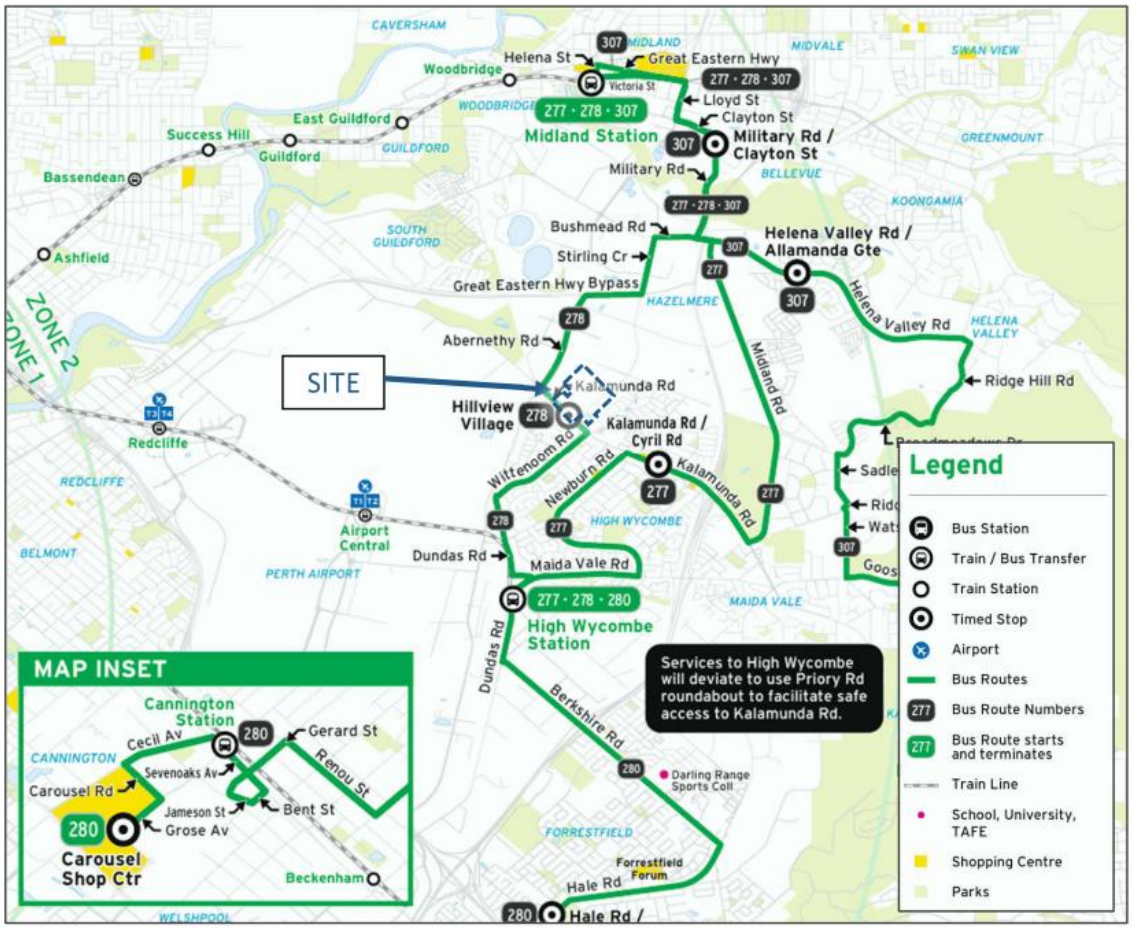
Figure 8 Existing Pedestrian/Cycle Network

Source: Department of Transport Bicycle Network Maps

3.5 Existing Public Transport Services

The nearest bus stops to the Site are located on the southern boundary of the LSP along Kalamunda Road, as highlighted in yellow in **Figure 9**. These stops service Transperth Bus Route 278 which travel between High Wycombe and Midland Train Stations. Other Public transport facilities in the vicinity of the LSP are illustrated in **Figure 10**. The service frequencies are summarised in **Table 4**.

Figure 9 Existing Bus Stop Locations



Source: Transperth

Table 4 - Bus Route Description and Frequency

Bus Route	Route Description	Weekday Frequency	Saturday Frequency	Sunday/Holiday Frequency
277	High Wycombe Station - Midland Station	24 – 30 mins	30 mins	30 mins
278	High Wycombe Station - Midland Station	24 – 30 mins	30 mins	30 mins
280	High Wycombe Station - Carousel Shop Ctr	20 – 30 mins	60 mins	60 mins
307	Kalamunda Bus Station - Midland Station	20 – 120 mins	No Service	No Service

Figure 10 Existing Public Transport Services

Source: Transperth

3.6 Existing Traffic Flows

The existing traffic volumes surrounding the LSP area were sourced from the Main Roads WA's Traffic Map database and are summarised in Table 5.

Table 5 Existing Traffic Volumes

Road Name	Source	Date	AM Peak (vph)	PM Peak (vph)	Weekday (vpd)	HV%
Stirling Crescent South of Great Eastern Highway Bypass	MRWA	2023/24	529	570	6,050	13.3%
Kalamunda Road South of Abernethy Road	MRWA	2023/24	1,067	1,068	12,753	7.6%
Kalamunda Road North of Abernethy Road	MRWA	2023/24	939	1,164	12,382	12.3%
Abernethy Road North of Kalamunda Road	MRWA	2023/24	1,039	1,032	12,649	33.4%
Abernethy Road / Brinsmead Road Intersection	MRWA	2022	811	975	11,649	29.7%

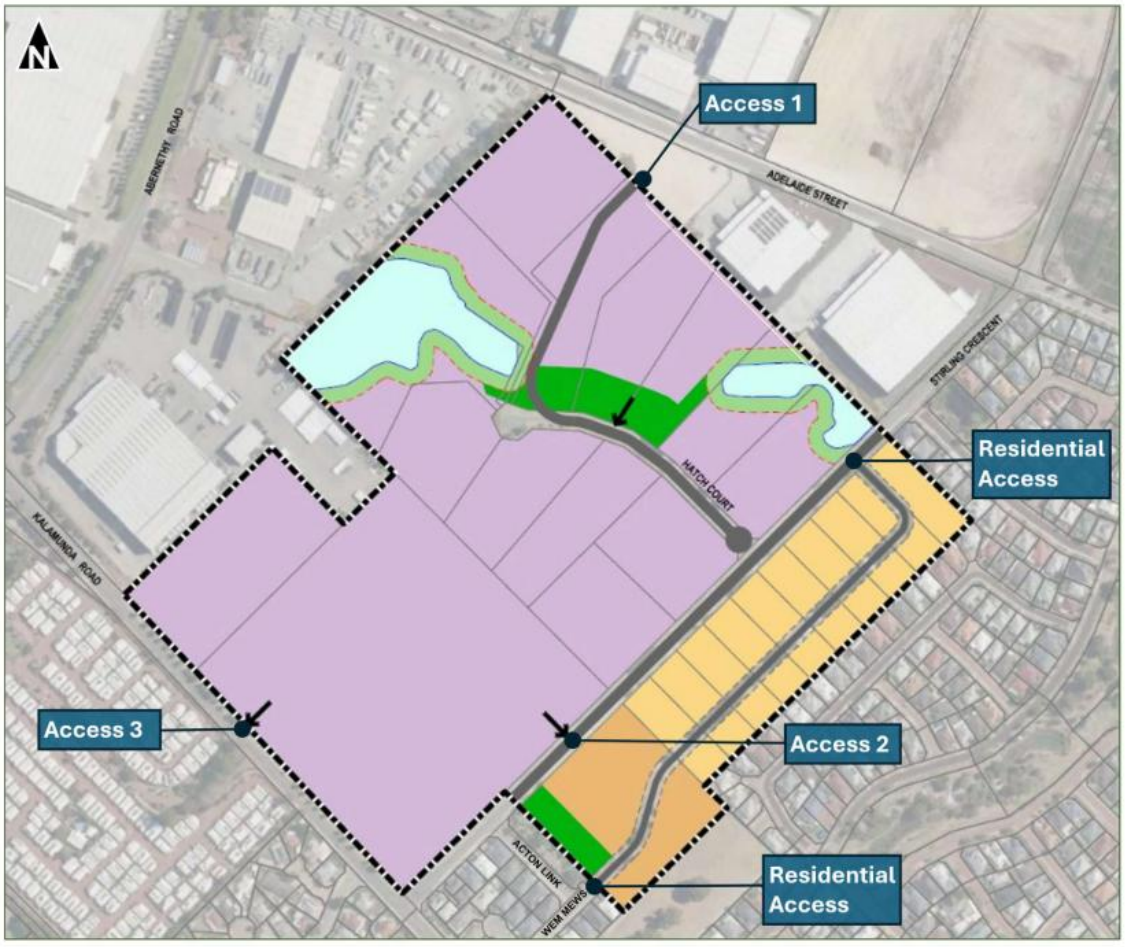
3.7 Existing Restricted Access Vehicle (RAV) Network

The Site is currently not directly connected to the RAV network. The nearest RAV routes are along Stirling Crescent (north of Adelaide Street) (RAV 4/5), Abernethy Road (RAV 7), portions of Kalamunda Road (RAV 1/4) and a portion of Adelaide Street (RAV 4), as shown in **Figure 11**. There is currently a proposed future RAV 7 connection along Adelaide Street as part of the Great Eastern Highway Bypass Interchanges project as discussed in Section 5.1.1.

However, once Peak Court is added to the RAV network, the site could have RAV access onto Adelaide Street and Stirling Crescent (north).

Figure 11 RAV Network Map

Source: Main Roads HVS Network Map



4 PROPOSED INTERNAL TRANSPORT NETWORKS

4.1 Changes/Additions to Existing Road Network of Proposed New Network

The proposed internal road hierarchy and indicative access points to the external network are shown in **Figure 12** and described below:

- Light Industrial Areas along Hatch Court will alternatively be accessed via Adelaide Street through Peak Court (existing stub road) through a proposed road with 20-m road reserve along Lot 13 as the existing connection of Hatch Court with Stirling Crescent will be converted to a cul-de-sac as shown. The road reserve of the currently constructed portion of Hatch Court will remain at 18m wide. The City of Kalamunda acquired Lot 13 for the purpose of the construction of Peak Court, a road link facilitating connection between Adelaide Street and Hatch Court.
- Lots 200 and 201 will have access crossovers via Kalamunda Road and Stirling Crescent.
- Residential lots will be accessed directly via Stirling Crescent and through a proposed road connecting Stirling Crescent to Wem Mews, with access back to Stirling Crescent via Acton Link.

Figure 12 Proposed Connections to External Road Network

Source: Dynamic Planning and Developments

As part of the LSP design development process, a high-level assessment was undertaken to evaluate several options for access arrangements as indicated in **Table 6**.

Table 6 Analysis of Access Arrangements

Option No.	Description	Pros	Cons
Option 1	Extension and construction of LSP Road through from Adelaide Street to Kalamunda Road with Hatch Court converted into a cul-de-sac	Improves overall traffic distribution, reduces pressure on Adelaide Street, supports development of Lot 200, and aligns with planning objectives to keep industrial traffic off Stirling Crescent.	Very costly ($4.3–$5.6 million), requires a major intersection upgrade at Kalamunda Road (signals or roundabout), may face strong community opposition, and could have issues with RAV4 route suitability on Kalamunda Road.
Option 2	Retention and modification of Hatch Court / Stirling Crescent intersection to allow access / egress onto Stirling with restricted industrial access	Distributes traffic more evenly and reduces pressure on Adelaide Street at a relatively low cost (about $915,000).	Conflicts with planning scheme provisions by allowing industrial traffic on Stirling Crescent, may impact nearby residential amenity, does not improve access to Lot 200, and may conflict with existing development approvals.
Option 3 (adopted option for TIA)	Cul-de-sac at Hatch Court and Stirling Crescent with new LSP road connection to Adelaide Street only	Most cost-effective option and aligns with planning objectives and existing approvals while still achieving acceptable traffic performance.	It does not improve access to Lot 200 and results in more traffic being concentrated at the Adelaide Street intersection.
Option 4	Minor extension of option 3 LSP Road to Lot 200 and retention of cul-de-sac at Hatch Court	Relatively low additional cost (around $600,000), provides some improved access for Lot 200, and may help reduce traffic on Kalamunda Road and Stirling Crescent.	Relies on existing access points, provides uneven benefits across the precinct, may face landowner objections, and complicates cost-sharing arrangements.
Option 5	Extension of option 3 LSP road through to lot 200 and a subsequent extension to Stirling Crescent	Improves traffic distribution and reduces pressure on Adelaide Street at a relatively low cost if funded by the developer	Conflicts with planning provisions by allowing industrial traffic on Stirling Crescent, has uncertain delivery timing, may face landowner objections, and creates uneven cost and benefit distribution across the precinct.

4.2 Road Reservation Widths and Cross Sections

The proposed road connecting Hatch Court to Peak Court (existing stub road intersecting with Adelaide Street) will have a 20m road reserve to allow RAV-4 access. However, the existing road reserve for the currently constructed portion of Hatch Court will remain at 18m wide. The proposed road within the residential lots will be consistent with the surrounding road network and will have a 16m road reserve with its connection to Mews Road adjacent to the Public Open Space (POS).

In accordance with the Liveable Neighbourhoods Guidelines, *Access Streets* are to accommodate shared pedestrian, bike, and vehicular movements and are capable of accommodating up to 3,000 vehicles per day (projected maximum volumes). For road reserves of up to 16m, which corresponds to Access Street C, the projected maximum volume is up to 3,000 vehicles per day. The Liveable Neighbourhood Guidelines is illustrated in **Table 7.**

Table 7 Function and characteristics of local streets

Street type and function	Street characteristics	Street name	Max design speed/ target operating speed (km/hr)	Indicative volume range* (vehicles per day)	Indicative street reserve width (metres)+	Indicative road pavement width (metres)
Access streets Access streets are to accommodate shared pedestrian, bike and vehicular movements. The requirements of adjacent land uses should be supported through street design.	Varied formats to suit a range of typical conditions in predominantly residential areas at different densities, and with different traffic volumes. An avenue access street (Access street A) with median is particularly suited to incorporation of a drainage swale. Access street B is a wider undivided street for situations with increased parking and/or traffic demand. The most typical and most common residential street will be Access street C – Yield street. Access street D is for short, low volume and low parking demand streets. In addition, a comprehensively designed variant with 3.5 m travel lane with indented parking, is also specified for very low volume short streets.	**Access street A** – avenue	50/40	3000	20-24	2 x 3.5 (or 2 x 3.6 under some conditions) plus indented parking.
		Access street B – wider street	50/40	3000	16.5-18	9.7
		Access street C – yield or give way street	50/40	3000	15.4-16	7.2 (7-7.5)
		Access street D – narrow yield or give way street	50/30	1000	14.2	5.5-6
			50/20	150	14.2	3.5 (plus parking indents)

Source: WAPC Liveable Neighbourhoods Guideline 2009

The indicative cross sections for the proposed roads within the structure plan are as shown from **Figure 13** to **Figure 15**.

Figure 13 Indicative Cross Section – Proposed Road for Hatch Court (with existing 18m road reserve width)

Source: Streetsketch

Figure 14 Indicative Cross Section – Proposed Road adjacent to Public Open Space and Residential (16m Reserve)

Source: Streetsketch

Figure 15 Indicative Cross Section – Proposed Internal Road for Hatch Court (20m Reserve)

Source: Streetsketch

4.3 Intersection Controls

As discussed in **Section 4.1**, the light industrial areas within the LSP, currently accessible through Hatch Court from Stirling Crescent, will instead be accessible via a proposed road extension running from Hatch Court's western end to the Peak Court stub road with the closure of the existing Hatch Court/Stirling Crescent intersection into a cul-de-sac. The new northern connection will be via the Peak Court stub, which has been constructed as a priority-controlled intersection with its junction at Adelaide Street. It is noted that the stop or give way control signs and lines are yet to be installed at the intersection.

The Access Crossovers for Lots 200 and 201 connecting to both Kalamunda Road and Stirling Crescent are to be located as per the existing crossover locations, and the final layout / design of the crossovers will be subject to the future developments requirements as determined through a detailed development application process.

Access to the residential lots will be done via a proposed access street, with a priority-controlled intersection off Stirling Crescent, and which will be connected to the existing Wem Mews, thereby providing residents another access point to Stirling Crescent to the south (through Acton Link). The intersections will be priority controlled with either a stop sign or give way sign (subject to detailed design and Main Roads approval) consistent with the requirements of Liveable Neighbourhoods.

4.4 Speed Limits

The indicative speed limits for roads within the LSP as shown in the previous section are as follows:

- Hatch Court – 50 km/h
- Peak Court – 50 km/h

» Proposed Access Road to Residential Area - 50 km/h

4.5 Pedestrian/Cycle Networks and Crossing Facilities

There are no proposed internal pedestrian/cycle networks within the Light Industrial section of the LSP area since access is mainly by personal vehicles and delivery vehicles.

As for the residential section of the LSP area, it is assumed that a 1.8m-wide footpath will be available east of the proposed roadway as shown in

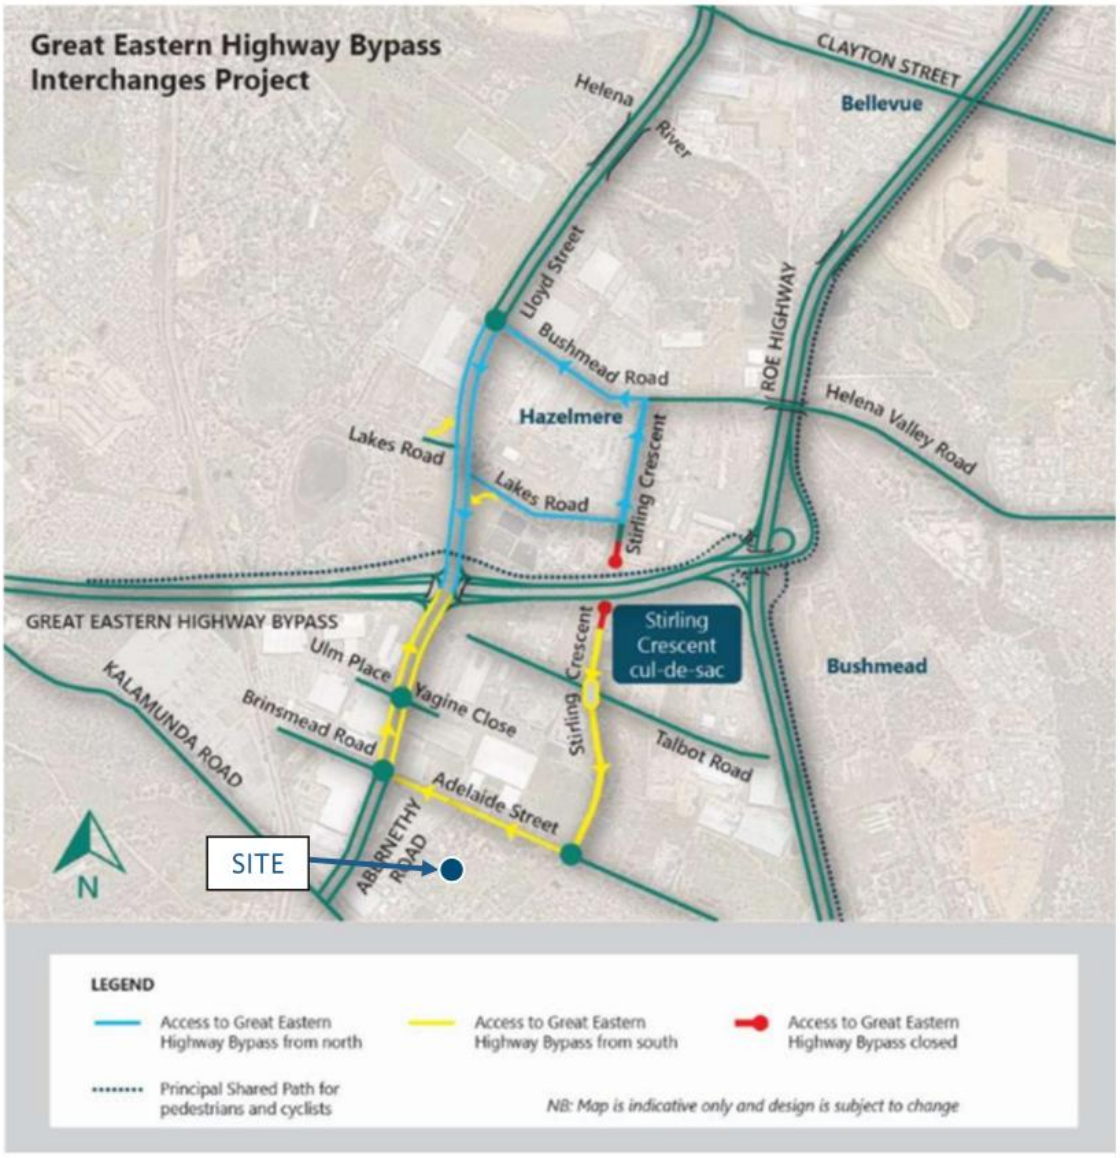
Figure 14 and **Figure 15**, consistent with the existing footpath available along Wem Mews and the surrounding road network.

4.6 Public Transport Routes

There are no proposed internal public transport routes existing or planned within the LSP area.

5 CHANGES TO EXTERNAL TRANSPORT NETWORKS

5.1 Road Network



5.1.1 Great Eastern Highway Bypass Interchanges Project

Main Roads WA is undertaking the Great Eastern Highway Bypass Interchanges Project which will have the following components:

- Lloyd Street will be extended via a bridge over Helena River which will improve access to Midland.
- Abernethy Road will be elevated to pass over Great Eastern Highway Bypass via a grade separated interchange to alleviate congestion at the signalised intersections of Great Eastern Highway Bypass and Abernethy Road, and Great Eastern Highway Bypass and Stirling Crescent.
- Parts of Abernethy Road will be duplicated and a RAV 7 compliant intersection with Adelaide Street will be provided.
- A grade-separated interchange will be built at the crossing of Great Eastern Highway Bypass and Roe Highway to provide free flowing access between the two roads, which is expected to benefit 60,000 road users per day.
- A new Principal Shared Path (PSP) for pedestrians and cyclists will extend from Roe Highway and Great Eastern Highway Bypass Interchange and connect to the PSP at the Roe Highway and Kalamunda Road Interchange.
- Corresponding road improvements will be done at Stirling Crescent and Adelaide Street to complement the proposed interchange.
- Adelaide Street / Stirling Crescent intersection will operate as a roundabout facilitating all vehicle movements.
- A new roundabout will be built at the intersection of Abernethy Road and Adelaide Street/Brinsmead Road, and Adelaide Street will be extended from its current end point to the new roundabout. Upgrades to the section of Abernethy Road between Kalamunda Road and Dundas Road are currently being finalised with details to be confirmed by MRWA.

According to the Main Roads WA website, pre-construction works have been completed along with upgrades to Adelaide Street. However, major construction works are currently placed on hold to secure approvals needed to commence construction.

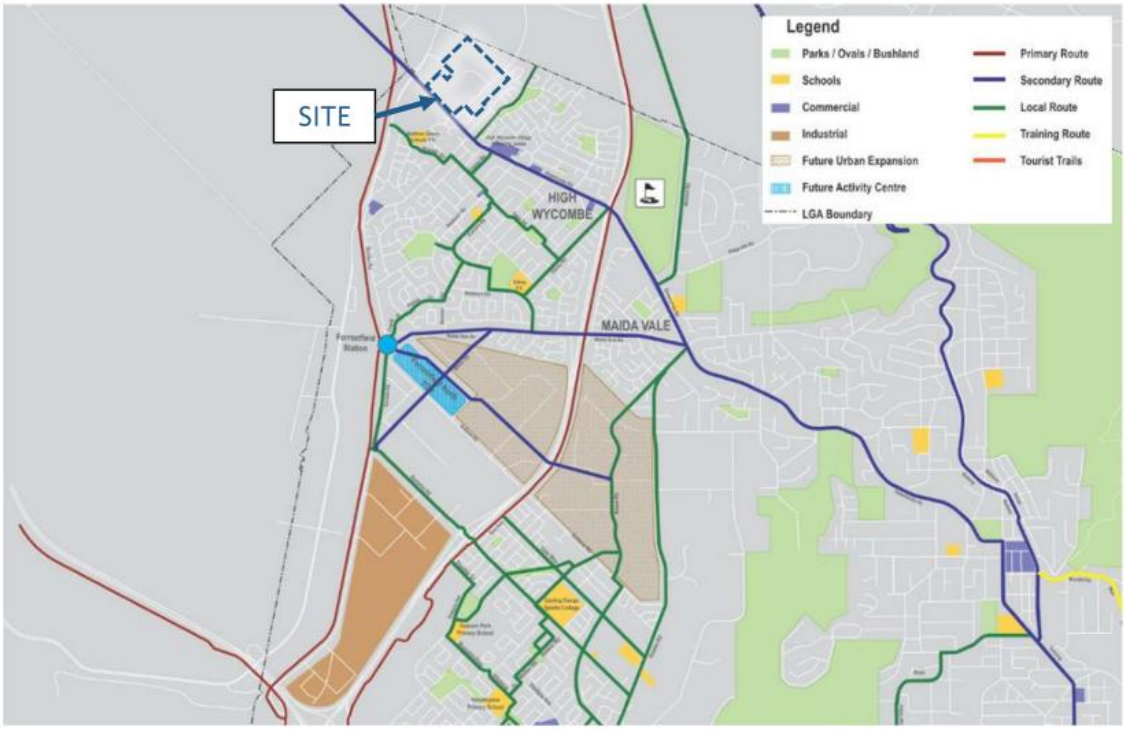
Figure 16 Great Eastern Highway Bypass Interchanges Project

Source: MRWA Great Eastern Highway Bypass Interchanges Project – Local Road Design Update – Stirling Crescent, Talbot Road, and Adelaide Street (August 2021)

5.2 Pedestrian/Cycle Networks and Crossing Facilities

As part of the Great Eastern Highway Bypass Interchanges Project, MRWA proposes to construct a new PSP along Great Eastern Highway Bypass and Roe Highway.

Figure 17 shows the Department of Transport's aspirational future cycling network within the Perth and Peel. The map shows the proposed cycle route hierarchy for the roads surrounding the proposed LSP which is summarised below.



- Great Eastern Highway Bypass – Primary Route
- Roe Highway – Primary Route
- Abernethy Road – Primary Route
- Kalamunda Road – Primary Route

Figure 17 LTCN Network

Figure 18 shows the ultimate network plan for the City of Kalamunda Bicycle Plan 2017. No new paths are proposed in the vicinity of the LSP which was to remain rural at the time the Bicycle Plan was prepared. The City of Kalamunda is expected to update the Bicycle Plan later this year.

Figure 18 City of Kalamunda Bicycle Plan 2017 – Proposed Ultimate Cycling Network

Source: City of Kalamunda

5.3 Public Transport Services

PTG has contacted the Public Transport Authority (PTA) and was advised that no significant changes are planned for the existing bus routes surrounding the LSP in the foreseeable future.

6 INTEGRATION WITH SURROUNDING AREA

6.1 Trip Attractors/Generators Within 800 Metres

Significant local attractors/generators within 800m include:

- Industrial estates along Abernethy Road, north and west of the LSP
- Matthew Gibney Catholic Primary School, South of Kalamunda Road
- Residential areas, east of Stirling Crescent and south of Kalamunda Road

6.2 Proposed Changes to Land Uses Within 800 Metres

Within the proximity of the LSP area, the High Wycombe Cell U2 Outline Development Plan has been identified as a proposed change to the land use within the surrounding area. While the proposed changes have mostly been identified to be adjacent to the High Wycombe Shopping Centre Area, most of the proposed changes pertaining to the residential developments east of the LSP area has already been constructed as of latest aerial imagery as shown in **Figure 2**.

Figure 19 High Wycombe Cell U2 Outline Development Plan

Source: City of Kalamunda

6.3 Travel Desire Lines from Structure Plan to these Attractors / Generators

The main access point to the LSP is anticipated to be via Adelaide Street / Peak Court stub for the industrial lots currently with direct access from Hatch Court, while Lot 200 and Lot 201 will have crossovers via Kalamunda Road and Stirling Crescent (as per existing). There will also be a new intersection connection via Stirling Crescent for the Residential portion of the LSP area.

Trips to and from the proposed LSP are expected to pass through Adelaide Street, Stirling Crescent, and Kalamunda Road to access the wider road network.

Trips from the industrial lots along Hatch Court will utilise Peak Court to exit onto Adelaide Street and pass through Abernethy Road.

Vehicles from Lots 200 and 201 will pass through Kalamunda Road and Stirling Crescent and travel along Abernethy Road or Roe Highway to access the wider road network.

Trips from the residential area are expected to exit via Stirling Crescent and travel along Kalamunda Road to reach shopping centres and schools primarily to the south and southeast of the Site.

6.4 Adequacy and Deficiencies of the External Transport Networks

Subject to the proposed changes to the External Transport Network outlined in Section 5, the adequacy of the external road network and pedestrian/cycle network will be assessed in **Section 7**.

The existing public transport routes are considered adequate to service the LSP area since there are several bus stops and routes within the vicinity of the Site and its accesses.

7 ANALYSIS OF TRANSPORT NETWORKS

7.1 Structure Plan Traffic Generation

The trip generation rates for the land uses within the LSP were based on the rates recommended in the WAPC Transport Impact Assessment Guidelines Volume 2 – Planning Schemes, Structure Plans and Activity Centre Plans, whilst the daily rates and trip directionality percentages have been taken from Transport for New South Wales – Guide to Transport Impact Assessment. Similar to industrial developments surrounding the Site, it is assumed that 30% of the total lot areas will be allocated to associated structures for 'light industry' upon full development of the local structure plan.

Table 8 shows the trip generation rates for the proposed land uses, **Table 9** shows the directional distribution and **Table 10** shows the total traffic generated by the proposed LSP.

Table 8 Trip Generation Rates

Land Use	Source	Yield	AM Peak Rate	PM Peak Rate	Daily Rate
Light Industry	WAPC / TfNSW	64,710 m^2	1 trip per 100 m^2	1 trip per 100 m^2	4 trips per 100 m^2
Residential (Low Density)	WAPC	140 dwellings	0.8 trips per dwelling	0.8 trips per dwelling	8.0 trips per dwelling

Table 9 Trip Directionality

Land Use	AM Peak		PM Peak		Daily	
	In	Out	In	Out	In	Out
Light Industrial	80%	20%	20%	80%	50%	50%
Residential (Low Density)	25%	75%	63%	38%	50%	50%

Table 10 Estimated Trip Generation

Land Use	AM Peak Trips		PM Peak Trips		Daily Trips	
	IN	OUT	IN	OUT	IN	OUT
Light Industrial	518	130	130	518	1,295	1,295
Residential (Low Density)	28	84	70	42	560	560
	546	214	200	560	1,855	1,855
	760		760		3,710	

The proposed local structure plan is estimated to generate 760 vehicle trips in each of the AM and PM peak hour periods with an estimated 3,710 vehicle trips daily.

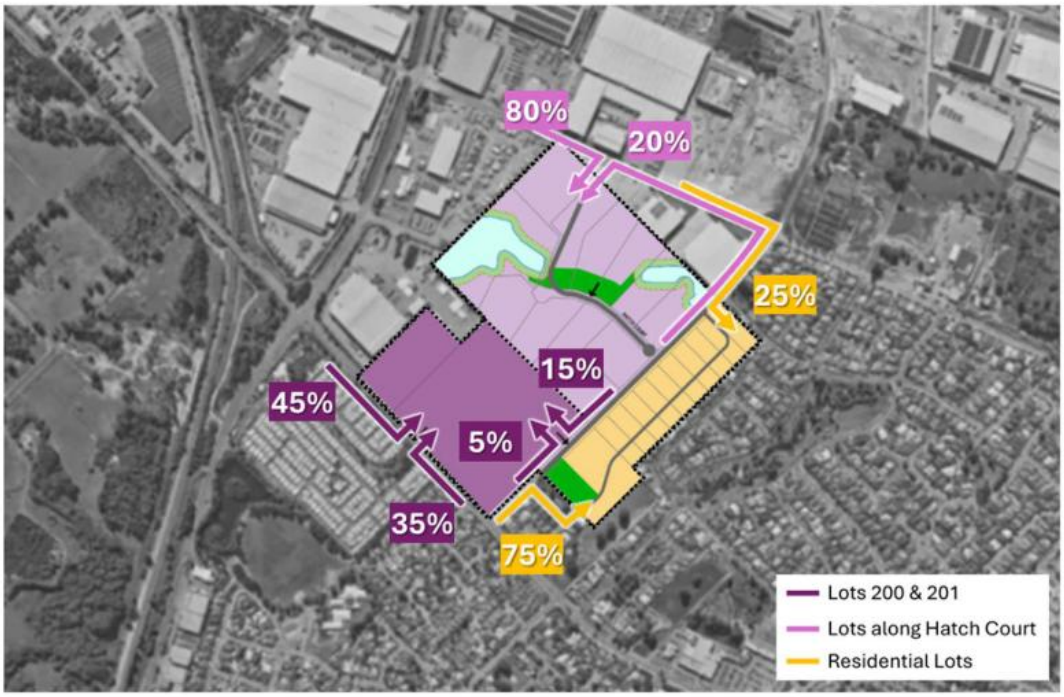
The light Industrial areas are estimated to dominate the share of total trips generated at 648 vehicle trips each in the AM and PM peak hour periods with 2,590 daily vehicle trips (71% of the total daily trips). The residential component of the LSP is estimated to generate 112 vehicle trips each in the AM and PM peak hour periods with at least 1,120 daily vehicle trips (30% of the total daily tips).

7.2 Traffic Distribution

Figure 20 and Figure 21 show the inbound and outbound distribution of the proposed LSP's estimated trip generation for the assumed year of full development. The trip distribution is based the location of the surrounding trip generators and assumes the completion of all works under the Great Eastern Highway Bypass Interchanges Project wherein the Abernethy Road and Adelaide Street will open and operate as a roundabout, and the Stirling Crescent intersection will close at Great Eastern Highway Bypass Road and will be converted into a cul-de-sac. This is expected to cause some traffic currently using Stirling Crescent to be diverted onto Abernethy Road.

Kalamunda Road provides direct connections to Roe Highway and Great Eastern Highway. Considering that the shortest distance to get into and out of the Site is through Access 3, it's reasonable to assume that majority of trips generated by L200 & 201 will utilise this access point. In addition, there is a desire by the City of Kalamunda to reduce industry related traffic on Stirling Crescent, and it is therefore likely, that future development of lot 200 and lot 201 will be encouraged to ensure as much traffic as practicable is kept away from the Stirling Crescent crossover access.

Figure 20 Trip Distribution – Inbound



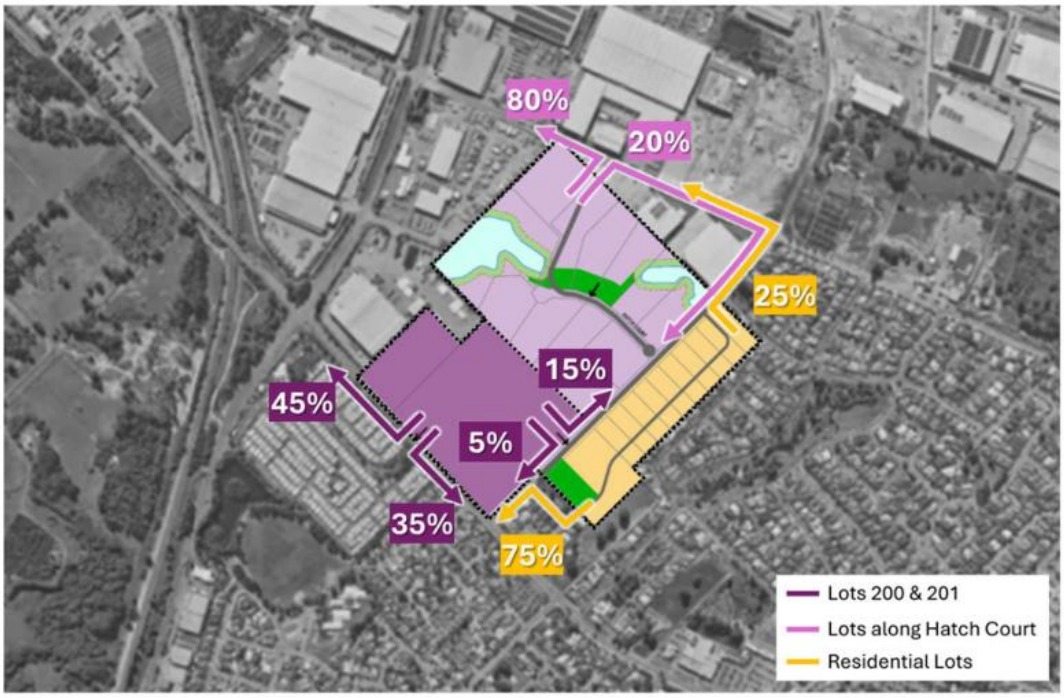


Figure 21 Trip Distribution - Outbound

7.3 Extraneous (Through) Traffic

Background traffic flows are indicated in **Figure 23**. High-resolution version of the figure is provided in **Appendix C**.

7.4 Key Intersections Analysis

7.4.1 Analysis Scenarios

A SIDRA analysis has been undertaken for the following key intersections shown in **Figure 22**:

1. Abernethy Road / Adelaide Street
2. Adelaide Street / Site Access 1 (Peak Court stub road)
3. Adelaide Street / Stirling Crescent
4. Stirling Crescent / Site Access 2
5. Stirling Crescent / Kalamunda Road
6. Kalamunda Road / Site Access 3
7. Kalamunda Road / Abernethy Road

Based on a 15-year horizon, the following scenarios have been adopted:

- Scenario 1 – 2041 Background Traffic
- Scenario 2 – 2041 With Development

Figure 22 Key Intersections

Source: Dynamic Planning and Developments

7.4.2 Assessment Parameters

Key assessment parameters and assumptions adopted for the SIDRA analysis are detailed below:

- Vehicles accessing Lots 200 and 201 will primarily utilise the crossover via Kalamunda Road since this road provides direct access to Roe Highway and Great Eastern Highway.
- Vehicles coming from northern generators will access Lot 200 via Stirling Crescent.
- The remaining industrial lots along Hatch Court will be accessed via Adelaide Street through Peak Court.
- At least 10% of the peak hour trips generated by the LSP's industrial lots are assumed to be heavy vehicle traffic. This number was adopted based on the historic peak hour heavy vehicle numbers along Stirling Crescent (north) and Kalamunda Road.
- Majority of trips for the residential area will be to places of work, shopping centres, schools, and other generators south of the Site.
- 25% of residential trips were assumed to be generated by the Midland town centre to the north of the Site.
- Closure of Great Eastern Highway Bypass / Stirling Crescent Intersection results to re-diversion of traffic from Stirling Crescent to Abernethy Road.
- Adelaide Street / Abernethy Road / Brinsmead Road and Adelaide Street / Stirling Crescent intersection will operate as a roundabout.

7.4.3 Intersection Performance

The intersections have been analysed using the SIDRA analysis program. This program calculates the performance of intersections based on input parameters, including geometry and traffic volumes. As an output, SIDRA provides values for the Degree of Saturation (DOS), queue lengths, delays, level of service, and 95th Percentile Queue. These parameters are defined as follows:

- Degree of Saturation (DOS): is the ratio of the arrival traffic flow to the capacity of the approach during the same period. The Degree of Saturation ranges from close to zero for varied traffic flow, up to one for saturated flow or capacity.
- 95% Percentile Queue Length: is the statistical estimate of the queue length up to or below which 95% of all observed queues would be expected;
- Average Delay: is the average of all travel time delays for vehicles through the intersection. An un-signalised intersection can be considered to be operated at capacity where the average delay exceeds 40 seconds for any movement;
- Level of Service (LOS): is the qualitative measure describing operational conditions within a traffic stream and the perception by motorists and/or passengers. Table 11 provides a description of the different levels of service with the Level of Service Target being LOS D. Exceeding this threshold indicates that the road section is exceeding its practical capacity. Above these values, users of the intersection are likely to experience unsatisfactory queueing and delays during the peak hour periods.

The acceptable value for average delay is according to the thresholds set by the Western Australian Planning Commission (WAPC) as summarised in Table 12 while the practical levels of Degree of Saturation (DOS) are according to the Austroads Guide to Traffic Management criteria as summarised in Table 13. In addition, the *Signal performance Requirements* as set out by Main Roads WA is summarised in Table 14.

Table 11 Level of Service (LoS) Performance Criteria

LOS	Description	Signalised Intersection	Unsignalised Intersection	Roundabout
A	No or minimal delays (best condition). Queues are rarely more than one vehicle	⩽10 sec	⩽10 sec	≤10 sec
B	Short traffic delays. Occasionally more than one queued vehicle.	10-20 sec	10-15 sec	10-20 sec
C	Average traffic delays. Often more than one queued.	20-35 sec	15-25 sec	20-35 sec
D	Longer traffic delays. Regularly more than one queued vehicle.	35-55 sec	25-35 sec	35-50 sec
E	Very long traffic delays. Traffic demand is near or equal to the practical capacity of the intersection. Almost always more than one queued vehicle.	55-80 sec	35-50 sec	50-70 sec
F	Forced flow conditions with extensive delays caused by geometric and/or operational constraints external to the intersection.	⩾80 sec	⩾50 sec	≥70 sec

Table 12 WAPC Thresholds for Average Delay

Criteria	Average Delay (sec/veh)
Signalised intersections	
> Average delay for all vehicles passing through the intersection	<55 secs
> Average delay for any individual vehicle, pedestrian or cyclist movement	<65 secs
Priority intersections (roundabouts, give way and stop)	
> Average delay for all vehicles on the non-priority arms (that is, have to give way or stop)	<35 secs
> Average delay for any individual vehicle, pedestrian or cyclist movement	<45 secs
Right turn lanes	
> Exclusive turning movement queue length	Less than available storage (95th percentile queue)

7.4.4 Background Traffic

The following assumptions were made when calculating the background traffic based on traffic volumes from MRWA Traffic Map:

- The LSP will be fully developed in 15 years' time.
- An annual growth rate of 1% will be used for the 15-year horizon scenarios.
- AM peak hour being 10% of ADT
- PM peak hour is 12% of ADT
- The Great Eastern Highway Bypass Interchanges Project will be completed by 2041.
- Stirling Crescent will be closed at the Great Eastern Highway Bypass Road and will be converted into a cul-de-sac. Existing traffic volumes indicate that 6,050 vehicles pass through Stirling Crescent daily, most of which are expected to be diverted towards Abernethy Road once it is closed. The following assumptions were considered for the Stirling Crescent traffic that will be diverted to Abernethy Road:
    - Daily: 1000 vehicles per day (with 13.3% HV) – it is assumed that only this portion of the daily Stirling Crescent traffic will utilise Abernethy Road. The remaining diverted traffic will likely utilise Roe Highway instead.
    - AM Peak: 100 vehicles per hour
    - PM Peak: 120 vehicles per hour
- 2022 traffic data from MRWA was used for the intersection of Abernethy Road and Kalamunda Road. A 1% growth rate was used to obtain background traffic counts for 2041. Heavy vehicles constitute 33.4% and 7.6% of the total vehicle counts along Abernethy Road and Kalamunda Road, respectively
- Adelaide Street will have a connection at Abernethy Road by 2041 and will operate as a roundabout, which is expected to increase traffic activity along Adelaide Street. There is currently a proposed RAV 7 connection along Adelaide Street as part of the GEHBI, which will cater to heavy vehicles accessing the Site and surrounding industrial lots. The HV% from traffic data along Abernethy Road was adopted for Adelaide Street.
    - Daily: 3000 vehicles per day (33.4% HV)
    - AM Peak: 300 vehicles per hour
    - PM Peak: 360 vehicles per hour

Traffic data for Scenario 1 (2041) are shown in **Figure 23**. High-resolution version of the figure is provided in **Appendix C**.

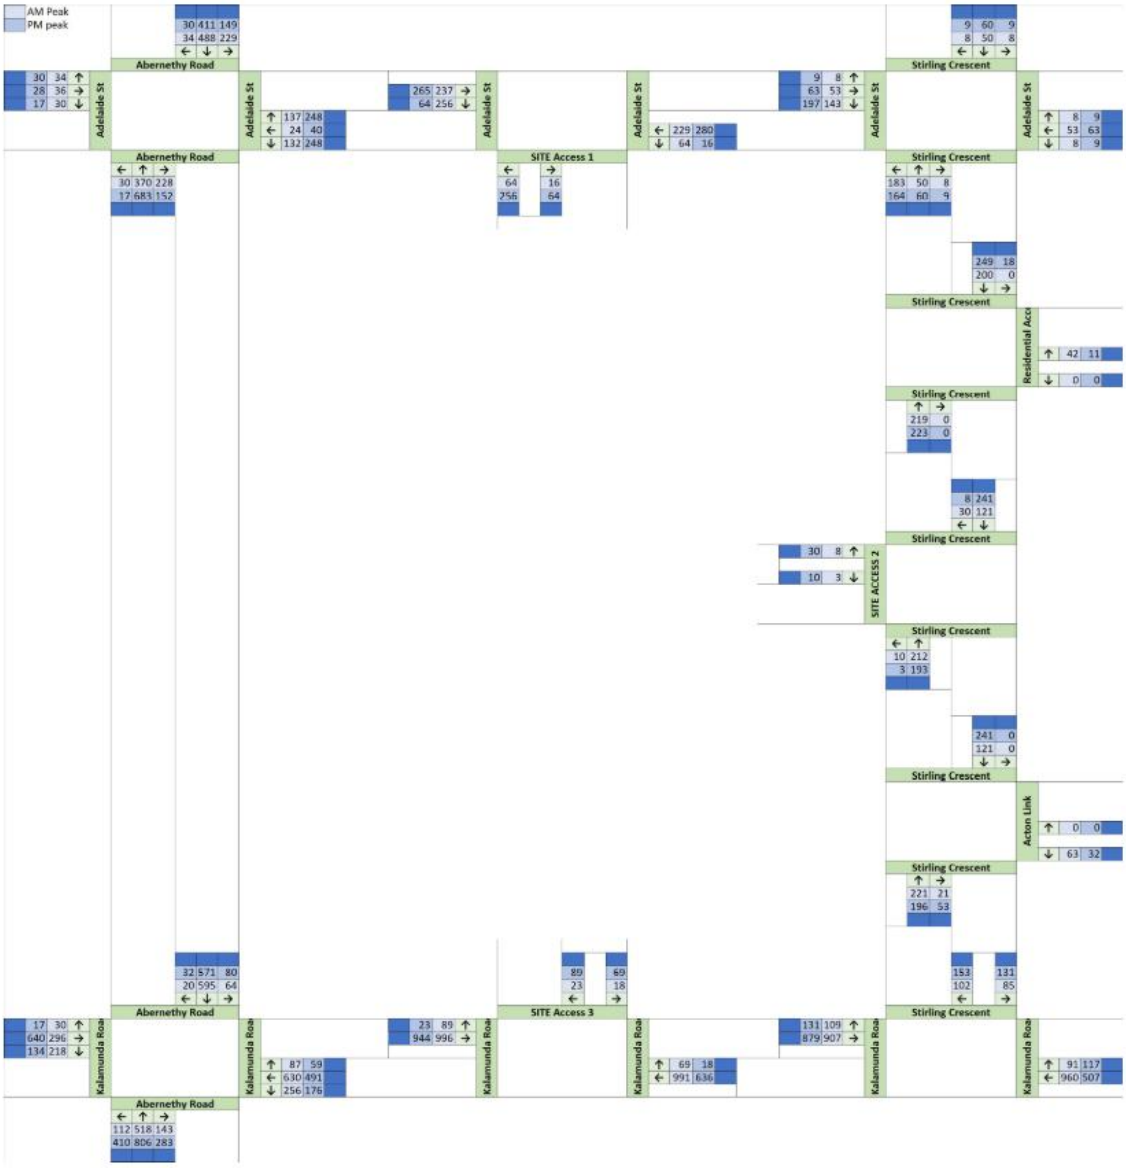

Figure 23 Background Traffic Data – Scenario 1 - 2041 Background Traffic

7.4.5 Traffic Volumes

Traffic volumes adopted for the SIDRA analysis for Scenario 2, which considers the background traffic and development traffic are shown in **Figure 24**. High-resolution version of the figure is provided in **Appendix C**.

Figure 24 Traffic Volumes – Scenario 2 – 2041 Background with Development Traffic

7.4.6 Abernethy Road / Adelaide Street / Brinsmead Road

The SIDRA layout adopted for Abernethy Road / Adelaide Street / Brinsmead Road intersection is shown in Figure 25.

The analysis results for the intersection are presented in Table 15 and Table 16, which indicate that the roundabout will operate satisfactorily in both scenarios, with a maximum LOS B, delay of 19.1 seconds, and degree of saturation 0.753. The degree of saturation is below the 0.85 DOS threshold set by Austroads for roundabouts.

7.4.8 Adelaide Street / Stirling Crescent

The SIDRA layout adopted for Adelaide Street / Stirling Crescent is shown in **Figure 27**, which will operate as a roundabout.

The analysis results for the intersection are presented in **Table 19** and **Table 20**. The results indicate that the intersection will operate satisfactorily in both scenarios with a maximum LOS B and will maintain a DOS <0.85.

7.4.10 Stirling Crescent / Kalamunda Road

The SIDRA layout adopted for Stirling Crescent / Kalamunda Road intersection is shown in **Figure 29**. The results of the analysis for the intersection are presented in **Table 23** and **Table 24**.

It is indicative that overall, the intersection will perform poorly due to the significant delays anticipated for either peak hour periods or assessment scenarios considered.

High volumes of background through traffic along Kalamunda Road causes right turn movements along Stirling Crescent and Kalamunda Road to perform poorly since right-turning vehicles have to wait to be able to safely cross the intersections. This results in a significant buildup of traffic and extended delays.

Future road developments such as the Great Eastern Highway Bypass Interchanges Project and related works are expected to improve overall network performance.

	T	0.545	0.1	A	0	0.543	0.1	A	0

Based on SIDRA analysis, the existing intersection at Stirling Crescent / Kalamunda Road will operate at a very poor level at full LSP buildout. A potential mitigation to the poor performance could be the conversion of the intersection into a roundabout layout as shown in **Figure 30.** The results show a significant improvement in intersection performance as seen in **Table 25,** with all legs experiencing LOS A-B and a maximum DOS at 0.566, which is below the Austroads threshold for roundabouts.

It should be noted that while the roundabout performs better than the existing priority-controlled intersection, the capacity of the road reserve to accommodate the modelled roundabout configuration will need to be assessed first. In addition, the proposed Local Structure Plan does not explicitly consider this intersection as a roundabout and this option was only considered in this assessment to present potential mitigation measures.

Alternatively, movement restrictions at this intersection, such as banning right turns, may be implemented as a more cost-effective option but may result in redistribution of traffic and decline of performance in other intersections within the network.

	T	0.545	3.8	A	0	0.543	3.8	A	0

Increasing the intensity of development as proposed within the LSP will result in an increase in the overall traffic and a decrease in intersection performance for non-upgraded intersections. There is no requirement for the intersections to be upgraded, however, the TIA report should provide upgrade options as required by the WAPC guidelines. However, it should be noted that the intersections will operate under worsening LOS in the future, even without development traffic.

7.4.11 Kalamunda Road – Site Access 3

The SIDRA layout adopted for the Kalamunda Road / Site Access 3 is shown in **Figure 31**. The analysis results for the intersection are presented in **Table 26** and **Table 27**.

The results indicate that the intersection operates satisfactorily in Scenario 1, with a maximum delay of 12.7 seconds at LOS B in the PM Peak. In Scenario 2, the maximum delay is anticipated to be 34.4 seconds, which occurs at the right turn lane of Site Access 3 in the AM peak hour period.

Overall, Scenario 2 reflects a shift from free flow to moderately constrained conditions, with the most significant effects on the eastbound approach and site access due to trips generated by the LSP. While performance remains generally acceptable, the increase in queue lengths, particularly on the east approach, may warrant consideration or intersection upgrades if traffic volumes increase further in the future.

7.4.12 Abernethy Road / Kalamunda Road

The SIDRA layout adopted for the Abernethy Road / Kalamunda Road is shown in **Figure 32**. The analysis results for the intersection are presented in **Table 28** and **Table 29**.

In Scenario 1 several movements operating at LOS F and degrees of saturation exceeding 1.0, particularly on the Abernethy Road south and Kalamunda Road west approaches in the PM. Delays are substantial (up to with very long queues (up to 635 m). Some movements, particularly on the north approach, continue to operate at acceptable levels.

Scenario 2 demonstrates most movements across all approaches operating at LOS F in both peaks. Delays increase further (exceeding 200 seconds), and queues are significantly longer (up to 732 m), indicating more widespread and consistent oversaturation. This may be attributed to the high volumes along Abernethy Road and the diversion of traffic from Stirling Crescent due to the closure of its intersection at Great Eastern Highway Bypass. Further detailed assessment should be undertaken to determine the most suitable mitigation measures.

High volumes of through traffic along Kalamunda Road and Abernethy Road causes turning movements along to perform poorly since vehicles have to wait to be able to safely cross the intersections. This results in a significant buildup of traffic and extended delays.

Overall, the assessment results indicate that the intersection will perform poorly and at capacity with just the projected background traffic growth by 2041. With the introduction of development traffic upon full development (under Scenario 2), the intersection will likely operate beyond its practical capacity, wherein significant delays and queueing are anticipated.

Figure 33 shows the indicative layout of the Abernethy Road / Kalamunda Road intersection with lane duplications, including the addition of right turn lanes at the south and west approach legs. In addition, signal optimisation was also considered.

Results of the analysis in **Table 30** show some improvement across all legs with the maximum delay anticipated to be 84.1 seconds for the right turn lane of the south approach leg in the PM peak period. However, this right turn movement will still operate at LOS F with a DOS of 0.952 and with an expected queue length of 93m.

It is noted that the proposed improvements at this intersection will perform better than the existing configuration. However, the capacity of the road reserve to accommodate these improvements will need to be assessed first. In addition, the proposed Local Structure Plan does not explicitly propose any lane duplications at this intersection and was only considered in this assessment to present potential mitigation measures.

7.5 Access Strategy

As discussed in Section 4.1, all future development traffic will access the site via a defined network of connections. Traffic from light industrial lots currently using Hatch Court will be redirected to Adelaide Street via the proposed Peak Court connection, following the conversion of the Hatch Court/Stirling Crescent intersection to a cul-de-sac.

Light Industry Lots 200 and 201 will be served by access crossovers to Kalamunda Road and Stirling Crescent, while residential access will be provided from Stirling Crescent via a proposed internal road linking to Wem Mews. Overall, the access strategy distributes traffic across multiple connections to support safe and efficient operation.

7.6 Restricted Access Vehicles (RAV) Network

As part of the Great Eastern Highway Bypass Interchanges project, a RAV 7 connection is proposed along Adelaide Street. Heavy vehicles are likely to utilise Adelaide Street to access the industrial area.

7.7 Pedestrian and Cycling Network

As discussed in Section 3.3, no internal pedestrian/cycling network are proposed within the light industry component of the LSP area, reflecting their primary function of accommodating private and heavy vehicle movements associated with the intended land use.

Accordingly, there is a proposed 1.8m-wide footpath along the proposed access road to the residential lots as discussed in Section 4.5 which may be able to connect to the existing footpath located along Stirling Crescent and Wem Mews as discussed in Section 3.4. This connection will facilitate pedestrian permeability and improve accessibility to and within the residential component of the LSP area.

7.8 Public Transport Access

As discussed in Section 3.5, there is an existing route that is available within the southern section of the LSP area which also has a nearby bus stop along Kalamunda Road. A 500-metre walking catchment for the nearest bus stop was conducted, as shown in

Figure 34, as WAPC guidelines indicate that 90% of street addresses within an LSP area should be within this radius of a Transperth Bus Stop. The assessment indicates that Light Industry Lots 200 and 201 fall within the catchment, along with approximately 40% of the proposed residential lots. This demonstrates partial, but not comprehensive, coverage of the LSP area.

Figure 34 Bus Stop Catchment Area (500 metres)

As outlined in **Section 4.6**, no internal public transport routes are currently proposed within the LSP area. Combined with the existing close spacing of stops along Kalamunda Road, this limits the justification for additional services penetrating the site. Consequently, the development is unlikely to meet WAPC accessibility thresholds for public transport in its current form.

A potential future bus route along Stirling Crescent, with a stop near the Hatch Court cul-de-sac, could improve overall accessibility. However, delivery of such a service is contingent on broader development progression and funding availability and therefore cannot be relied upon at this stage.

8 SAFETY ISSUES

8.1 Crash Assessment

A crash assessment for the surrounding road network of the Site has been completed using Main Roads WA Reporting Centre. The assessment covers all the recorded crashes for the 5-year period between 1 January 2020 to 31 December 2024 along the roads surrounding the Site.

The crash locations and severity of these crashes for intersection and midblock crashes are illustrated in **Figure 35** while **Table 31** to **Table 38** provides the summary of all crashes that occurred within the vicinity of the Site.

Figure 35 Crash Locations

Source: Main Roads WA Reporting Centre

Crash data is summarised as follows:

- A total of thirty-nine (39) crashes were recorded within the vicinity of the Site, with no fatal crashes recorded.
- Seven (7) crashes were located at the intersection of Stirling Crescent and Adelaide Street which resulted in 1 Medical and 6 PDO Major.
- Nine (9) crashes were recorded at the intersection of Stirling Crescent and Kalamunda Road which resulted in 3 Medical, 4 PDO Major, and 2 PDO Minor.
- Thirteen (13) crashes occurred at the intersection of Kalamunda Road and Abernethy Road which resulted in 4 Medical, 5 PDO Major, and 4 PDO Minor.
- One (1) intersection crash is recorded at Abernethy Road – Adelaide Street.
- Four (4) midblock crashes were recorded along Stirling Crescent between Adelaide Street and Kalamunda Road, with two (2) crashes resulting in major property damage.
- Four (4) midblock crashes were recorded along Kalamunda Road, between Stirling Crescent and Abernethy Road which resulted in 1 Medical crash.
- One (1) midblock crash was reported along Abernethy Road, between Kalamunda Road and Adelaide Street.

Overall, the recorded crash history does not indicate any significant road safety issues that are likely to be exacerbated by the development of the LSP. The distribution of crashes in the study area generally corresponds to the higher traffic volumes along Kalamunda Road.

The number of crashes recorded at the Stirling Crescent/Adelaide Street intersection is indicative of the current 'rural' type road layout with growing traffic volumes resulting from the surrounding residential and industrial developments.

There are two significant planned changes to the road network that will likely reduce the frequency and severity of crashes at this location in the near future:

- Closure of Stirling Crescent at Great Eastern Highway Bypass will significantly reduce the volume of traffic using Stirling Crescent as a through route between Kalamunda Road and Great Eastern Highway Bypass. Due to the altered access arrangements, this traffic will likely divert via Kalamunda and Abernethy Roads, with only local traffic using Stirling Crescent.
- Construction of a roundabout at the Stirling Crescent / Adelaide Street intersection. The roundabout intersection will likely eliminate right-angle crashes at this intersection as well as reduce the speed of vehicles through the intersection.

9 CONCLUSIONS

This Transport Impact Assessment has been prepared in accordance with the *WAPC Transport Assessment Guidelines for Developments: Volume 2 – Planning Schemes, Structure Plans and Activity Centre Plans* (2016).

The following conclusions have been made in regard to the proposed Local Structure Plan:

- The proposed LSP is located in a predominantly residential area with industrial lots within High Wycombe in the City of Kalamunda. It is bounded by Kalamunda Road, Stirling Crescent, and Adelaide Street.
- The proposed LSP is estimated to yield 21.57 ha of industrial land and 4.9126 ha of residential lots.
- Public transport is considered to be good since there are several bus stops and routes along the Site's boundaries.
- Access strategy to the proposed LSP areas is summarised as follows:
    - Industrial lots will have at least three (3) access points: one will be via Adelaide Street through Peak Court and for industrial lots fronting Hatch Court. For industrial lots within Lots 200 and 201, one access point is proposed along Stirling Crescent, and another access point is proposed along Kalamunda Road, and
    - An intersection at Stirling Crescent connecting to Wem Mews Road and Acton Link is proposed for access to the residential lots.
- Due to the significant traffic volume, Other Regional Road status and existing residential developments fronting Kalamunda Road adjacent to the LSP site, access directly from the Kalamunda Road frontage is to be limited to a single crossover, proposed to remain as currently located. Similarly with Stirling Crescent, no additional crossovers are to be permitted under the LSP for future developments due to the desire to retain as much "residential amenity" for the Stirling Crescent road environment as practicable.
- Pedestrian and cycle routes are considered to be average since there are discontinuities in the network and some roads do not have dedicated pedestrian paths.
- Analysis of the key intersections on the external road network has been undertaken with the following conclusions:
    - The Abernethy Road / Adelaide Street / Brinsmead Road roundabout is expected to perform satisfactorily on either assessment scenarios considered.
    - The Adelaide Street / Site Access 1 – Peak Court intersection is expected to maintain satisfactory performance in both scenarios with most legs experiencing LOS A.
    - The Adelaide Street / Stirling Crescent roundabout is also expected to operate satisfactorily in both scenarios with a maximum LOS B and DOS <0.85.
    - The Stirling Crescent / Site Access 2 intersection is expected to maintain LOS A and DOS <0.8 even after full development.
    - The Kalamunda Road / Stirling Crescent Intersection is anticipated to operate beyond practical capacity considering the 2041 background traffic volumes only. The intersection's performance will further deteriorate considering the addition of LSP-generated traffic with significant delays and vehicle queueing anticipated particularly at the north leg's (Stirling Crescent) right turning lane. It is noted that the roundabout configuration is considered as a potential mitigation measure only and that the ability to accommodate a roundabout within the existing available road reserve would need to be investigated in detail. Alternatively, movement restrictions at this intersection, such as banning right turns, may be implemented as a more cost-effective option but may result in redistribution of traffic and decline of performance in other intersections within the network.
    - The Kalamunda Road / Site Access 3 intersection will generally operate satisfactorily in both assessment scenarios. However, Scenario 2 reflects a shift to moderately constrained conditions, with impacts concentrated on the eastbound approach and site access; while performance remains acceptable, increased queuing may warrant future monitoring or upgrades.
    - Analysis of the Abernethy Road / Kalamunda Road intersection indicates that the intersection operates under poor conditions in both scenarios, with Scenario 1 showing several movements, particularly on the Abernethy Road south and Kalamunda Road west approaches, operating at LOS F in the PM peak. In Scenario 2, performance is further degraded, with most movements operating at LOS F in both peak periods, indicating widespread oversaturation likely associated with high traffic volumes on Abernethy Road and redistributed traffic. SIDRA analysis show that the considered potential mitigation measure such as lane duplication and signal optimisation will result in significant improvements in the performance of the intersection.

Executive Summary

Study Context

This report was prepared by Macroplan (the author) for the City of Kalamunda (the City). This report provides an independent Economic Impact Assessment (EIA) in relation to the Hatch Court and Stirling Crescent Local Structure Plan (LSP).

This report provides insights in relation to the likely direct and indirect economic and employment benefits that may arise from the future developments in the LSP together with wider qualitative economic, social and community benefits.

Hatch Court & Stirling Crescent LSP

The Hatch Court and Stirling Crescent LSP is in the northwest of High Wycombe, approximately 3.5 km northwest of the Perth Airport and 13 km from the Perth CBD. It is strategically located on the interface of the existing industrial precinct in Perth Airport / Hazelmere and residential areas in High Wycombe.

The Hatch Court precinct is zoned for Light Industrial while the Stirling Crescent precinct is zoned for Urban Development with the preferred uses being residential.

Several interventions and studies have been undertaken by the City concurrently with the preparation of the LSP. These interventions and studies have informed the recommended options for re-alignment of road access and connection of living stream to wetlands, which provides a framework for shaping the LSP. This framework concept indicates approximately 21.57 hectares of net development areas (NDAs) for industrial uses in the Hatch Court precinct and 4.7 hectares of NDA for residential uses in the Stirling Crescent precinct.

Relevant assumptions have been made based on the City's instructions and it is estimated that the Hatch Court precinct may accommodate around 94,908-118,635 sqm gross floor area (GFA) of industrial floorspace while the Stirling Crescent precinct may yield around 115-125 dwellings when fully built out, subject to design and layout.

The LSP is anticipated to complete in mid-late 2028, while the developments in the LSP will be generally led by market.

Key Economic Impacts

The potential industrial and residential developments in the LSP will deliver several economic and community benefits to the local area and wider region.

Key quantifiable economic impacts that may arise from the potential developments are summarised below.

- The construction of the developments together with the delivery of enabling infrastructure in the LSP may attract an estimated total of **$177.6-$219.1 million** of construction investment. This initial construction investment is expected to create another **$220.8-$272.3 million** production-induced indirect output and **$140.8-$173.6 million** consumption-induced output elsewhere in the wider economy. This totals **$539.2-$665.1 million** construction output (including direct and indirect) to the economy during the construction phase.

- The construction of the developments and infrastructure is expected to generate approximately **335-414** direct construction full time equivalent (FTE) jobs on site, plus another **451-556** production-induced indirect FTE jobs and **425-524** consumption-induced indirect FTE jobs elsewhere in the economy. This totals **1,211-1,494** construction related FTE jobs during the construction phase.

- Upon completion, the developments will accommodate a mix of industries which are anticipated to be anchored by transport, postal and warehousing, manufacturing and construction, followed by wholesale trade, mining and other services (i.e. repair and maintenance), and supplemented by business services, professional services and other supporting services benchmarking to the current industrial mix in the existing Forrestfield / High Wycombe industrial precinct, as well as some home based businesses.

- These anticipated uses in the LSP are likely to create around **864-1,079** ongoing FTE jobs on site when fully operational, which will support a further **605-756** production-induced FTE jobs and **766-957** consumption-induced FTE jobs elsewhere in the economy. This totals **2,235-2,792** direct and indirect FTE jobs in the local and regional economy.

- The ongoing employment operating in the LSP is also expected to create approximately **$354.8-$443.3 million** direct economic output per annum, translating to another **$278.9-$348.5 million** production-induced indirect output and **$253.6-$316.8 million** consumption-induced indirect output per annum elsewhere in the economy. This totals **$887.2-$1,108.6** million direct and indirect economic output per annum.

- The Stirling Crescent residential precinct is expected to accommodate approximately **269-292 residents** upon completion, who has the capacity to generate up to **$14.5-$15.8 million** consumption expenditure per year.

- The industrial and residential developments in the LSP will also generate an estimate of approximately **$1.7-$2.1 million** industrial and residential rates revenue per annum (subject to future valuation undertaken by the Valuer-General), which is a net increase of approximately **$1.6-$2.0 million** from the current level.

Table 1 Key Economic Impact Summary

Item	Direct	Indirect		Total
		Production	Consumption	(D+P+C)
Construction Output ($M)	177.6-219.1	220.8-272.3	140.8-173.6	**539.2-665.1**
Construction Employment (FTE)	335-414	451-556	425-524	**1,211-1,494**
Ongoing Output ($M)	354.8-443.3	278.9-348.5	253.6-316.8	**887.2-1,108.6**
Ongoing Employment (FTE)	864-1,079	605-756	766-957	**2,235-2,792**
Residents' Consumption Expenditure ($M)	14.5-15.8	-	-	**-**
Increase in Rates Revenue($M)	1.6-2.0	-	-	**-**

Source: ABS, ABS Census 2021, City of Kalamunda (2026), City of Sydney Floor Space and Employment Survey (2022), JLL (2026), MarketInfo, Rawlinsons Australian Construction Handbook, SQM Research (2026), Macroplan

In addition, the proposed facility will also deliver a number of non-quantifiable economic and community benefits.

The proposed land uses and developments in the LSP will transform underutilised land into productive land and provide the much-needed industrial and housing supply amid the currently extremely constrained industrial market in Perth and nationwide housing shortage. It can leverage its locational advantages adjacent to major transport infrastructure and existing industrial precincts, simulating investments, economic activities, employment opportunities, industrial clustering, and improved productivity, while mitigating adverse amenity impacts on the

residential precinct by appropriate re-alignment of road access. This will assist with the achievement of progressive value uplift and upgraded branding to the wider precinct.

The indirect social benefits of increased employment opportunities involve broader improvements in wellbeing, stability and social outcomes for individuals, households and community, which lies beyond the direct benefits to the employees supported by the specific developments.

Overall, the proposed industrial and residential uses in the LSP address the current undersupply of both uses and will deliver multiple benefits to the economy and community at both local and regional levels.

The detailed benefits are elaborated upon in this report.

Introduction

This report has been prepared by Macroplan (the author) for the City of Kalamunda (the City). This report provides an independent economic impact assessment (EIA) in relation to the Hatch Court and Stirling Crescent Local Structure Plan (LSP).

The draft LSP is currently under preparation aiming at public advertising by the City of Kalamunda Council in mid-2026 and submission to the WA Planning Commission (WAPC) in late 2026.

This report provides insights in relation to the likely economic and employment benefits that may rise from the future developments in the LSP, both directly and indirectly, together with various non-quantifiable wider economic, social and community benefits.

This report is presented as follows:

- **Section 1: Precinct & Regional Overview** – provides an overview of the LSP and the regional context of City of Kalamunda.
- **Section 2: Economic Impact Assessment** – provides an assessment estimating the likely economic output and employment benefits to be supported by the future developments in the LSP during the construction phase and upon completion, both directly and indirectly.

1 Precinct & Regional Context

1.1 The Subject Precinct

The Hatch Court and Stirling Crescent LSP is located in the northwest of High Wycombe, within the City of Kalamunda. It is approximately 3.5 km northwest of the Perth Airport and 13 km from the Perth CBD. The LSP is strategically located on the interface of the existing industrial precinct in Perth Airport / Hazelmere and residential areas in High Wycombe.

The Hatch Court LSP involves the Hatch Court Light Industrial Area (HCLIA) bounded by Kalamunda Road, Stirling Crescent, and Adelaide Street. It abuts the existing industrial areas to the northwest, with residential uses including a lifestyle village to the southwest of Kalamunda Road and southeast of Stirling Crescent.

With approximately 30 hectares of gross land area, the majority of the area is zoned for Light Industrial and partially subject to Bushfire Prone Areas under the *City of Kalamunda Local Planning Scheme* (LPS) No. 3. Based on the LPS, the area is permitted for uses of light industry and general industry, with industrial development subject to planning approval.

There are currently 15 lots from around 1 hectare to up to 8 hectares within the Hatch Court LSP, totalling 25.8 hectares of gross developable area. Only Lot 200 is currently developed as hardstand, with the balance of the precinct largely undeveloped. Several other lots have been granted with development approvals, but development have not yet been implemented.

The Stirling Crescent LSP is located to the southeast of the Stirling Crescent, adjacent to the Hatch Court precinct to the north and the existing residential area to the south, northeast and southwest. With approximately 6 hectares of gross land area, the Stirling Crescent LSP is currently zoned for Urban Development and partially subject to Bushfire Prone Areas under the LPS. There are currently 11 lots within the Stirling Crescent LSP, 10 of which area around 4,000 sqm except one being 20,000 sqm. Most of these lots are used for one storey detached houses.

Current access to the precinct is predominantly via the existing Stirling Cresent and Hatch Court.

There are also two large Class 2 wetlands at extremities, linked by open drainage channels, with environmental buffer zones around the wetlands and drainage.

Map 1.2 Hatch Court and Stirling Crescent LSP

Source: City of Kalamunda (2026), MetroMap (2026), Macroplan

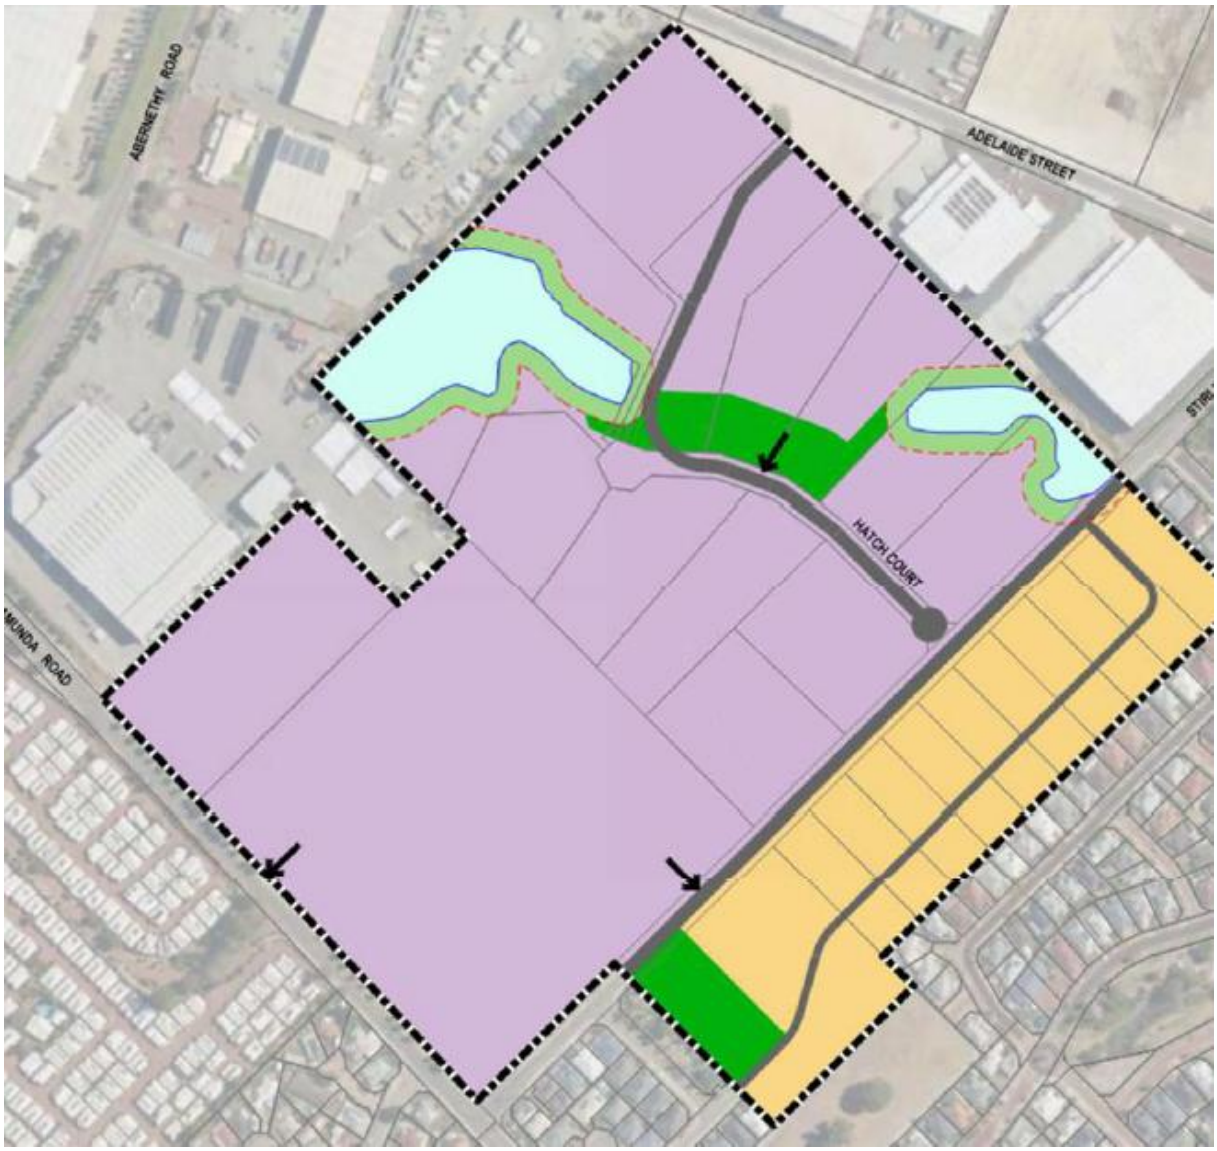
1.2 Proposed Land Uses

To facilitate coordinated development within the Hatch Court and Stirling Crescent LSP, the City has undertaken a number of interventions concurrently with the preparation of the LSP. This includes the following:

- Purchase of land at Lot 13;
- Ceding of Peak Court access road from Adelaide Street as public road;
- Provision of Local Planning Policy No 35 as interim development control to the Hatch Court precinct; and
- Appointment of consultants to advise on the LSP and Development Contribution Plan (DCP).

These interventions together with advice received from consultants on the re-alignment of road access and connection of living stream to wetlands provide a framework for shaping the LSP. At the time of preparing this report, consideration by the City and consultants of the likely recommended features of the LSP include the following:

- A new access road over Lot 13 from Adelaide Street into the Hatch Court precinct connecting to the existing Hatch Court;
- Cul-de-sac of Hatch Court to protect residential amenity of the Stirling Crescent precinct with the Stirling Crescent being a logical boundary between industrial and residential uses;
- Controls over access from Lot 200 onto Kalamunda Road and Stirling Crescent;
- A new access road through the Stirling Crescent connecting to the intersection of Wem Mews and Acton Link;
- Re-alignment of living stream to Hatch Court and connection to wetland on Lot 11 to improve ecological outcomes and optimise developable areas; and
- The preferred outcome being a residential precinct for the Stirling Crescent precinct with R25 density which would facilitate typical lots of 12-metre wide and 32-metre depth.



Based on the above, it is estimated that the net development areas (NDAs) for the Hatch Court and Stirling Crescent LSP are 21.57 hectares for industrial uses and 4.7 hectares for residential uses respectively.

Upon a review of the built forms of similar lots in the industrial precincts in Perth Airport / Hazelmere and High Wycombe / Forrestfield, it is also assumed around 40%-50% site coverage and average of 1.1 levels for future industrial developments in the Hatch Court precinct. This may result in an estimated industrial gross floor area (GFA) of 94,908-118,635 sqm when fully built out.

For the Stirling Crescent precinct, applying the R25 density and typical lot dimension, this may yield around 115-125 dwellings, subject to design and layout.

The LSP is anticipated to complete in mid-late 2028, while there is currently no timeframe for the developments in the LSP which is generally led by market.

Map 1.3 LSP Concept Framework

Source: City of Kalamunda (2026)

1.3 Regional Context

The Hatch Court and Stirling Crescent LSP is located in the City of Kalamunda and adjacent to the Perth Airport.

The City of Kalamunda is home to an estimated resident population (ERP) of approximately 65,000 residents as of 2025. It grew by 1.7% per annum on average from the last Census in 2021. While this growth rate is below that of the Greater Perth, the City of Kalamunda has generally maintained steady population growth during the past decade.

As an outer area of the Greater Perth, the demographic profile of the City is largely characterised as older, more affluent, more family dominant, but less diverse. The current housing provision is generally homogeneous with the majority being separated houses, resulting in a lower population and dwelling density compared to the Greater Perth average. The home ownership is higher in the City than the Greater Perth average.

Of the resident population aged 15 year and over living in the City of Kalamunda, approximately 29,000 residents were employed as at the 2021 Census. Over half of them were employed in health care and social assistance, construction, education and training, retail trade, mining, and transport, postal and warehousing.

The 2021 Census also reports a total of 16,385 local workers working in the City as of 2021. Over 60% of them were working in transport, postal and warehousing, education and training, construction, healthcare and social assistance, retail trade and manufacturing. The transport, postal and warehousing sector is the largest employing sector in the City. This is more prominent in Forrestfield where the largest existing industrial precinct in the City is located, together with other industrial sectors such as manufacturing and construction.

While there appears to be significant existing industrial precincts in Forrestfield / High Wycombe and Perth Airport / Hazelmere, the available industrial land and floorspace in these precincts and the wider Perth region is extremely constrained. Research indicates that industrial vacancy rates have remained below 2% since around 2022 and take-up over the past 12 months exceeded the 10-year average with new supply not being able to keep up with continuing demand. The demand for industrial land has been led by the transport, postal and warehousing, manufacturing, resource and retail sectors, as observed in the industrial precincts in Forrestfield / High Wycombe and Perth Airport / Hazelmere.

The demand for industrial land and floorspace is anticipated to remain solid during the short-term horizon, with potential increasing requirements toward smaller formats. However, new supply is expected to remain constrained, with limited serviced land and more cautious development sentiment, particularly for core precincts which are expected to remain severely undersupplied. This will continue to put downward pressure on vacancy rate.

Given the current industrial market and development environment, the Hatch Court LSP will play an important role in providing the much-needed developable industrial land adjacent to the Perth Airport / Hazelmere industrial precinct.

The detailed data in relation to the regional context is contained in Appendix 1.

2 Economic Impact Assessment

2.1 Overview

An EIA identifies the key economic impacts of a project, both quantitative and qualitative impacts (where they can be addressed) on the local and regional economy. The key economic indicators assessed include the following:

- Construction impacts, including estimated construction investment, output and related employment,
- Ongoing employment and economic output,
- Residents and expenditure,
- Estimated rates revenue, and
- Broader economic, social and community impacts.

To quantify potential economic impacts from the construction of a project, the Australian Bureau of Statistics (ABS) Input-Output (I-O) tables (2023-24) are used as a basis for calculating the flow-on impacts of initial capital expenditure upon local and wider economy in the construction sector both directly and indirectly. The I-O tables are an economic accounting framework published by the ABS. They show what each industry produces in the Australian economy, how each industry supplies its inputs from other industries to produce output, and who uses the output (e.g. other industries or final consumers).

The I-O multipliers are derived from the ABS I-O tables. They quantify how much economic activity (e.g. economic output and employment) is created across all industries to generate final demand for an industry's output. Output and employment multipliers have been used in this assessment to estimate the above economic indicators, which involve the following three folds in terms of impact in the economy:

- Direct impacts – including economic output and employment created in that industry, such as construction and manufacturing based on the *Australian and New Zealand Standard Industrial Classification* (ANZSIC).
- Indirect impacts: production-induced– which include the amount of economic output and employment required from all industries of the economy to produce the initial investment and all the subsequent induced output, such as manufacturing of building material / equipment, transport, postal and warehousing of material / equipment, professional, scientific and technical services, financial and insurance services, administrative and support services, and other services that support the construction and operation of the proposed development.
- Indirect impacts: consumption-induced – which include the amount of economic output and employment required from all industries of the economy to support the commodities and services that are spent by wage and salary earners to produce the initial investment and the production-induced output, such as, employees' spending their incomes at local supermarkets, retail, accommodation and food services, health and education, and various services.

The I-O multipliers have been adjusted by location quotients for Western Australia (WA) based on the latest employment status by industry as of February 2026.

More information relating to the methodology, glossary of terms and limitations of the quantitative assessment of an EIA is contained in the Appendices 2-4.

To quantify ongoing / operational phase economic impacts upon project completion, several assumptions and benchmarks regarding employment densities and expenditure are applied, together with relevant I-O multipliers (where applicable).

There are also a range of impacts which cannot be quantified. In this case, a qualitative approach is undertaken to assess the impacts likely to be generated by the project on the wider economy

2.2 Construction Impacts

To estimate the likely construction investment for the potential developments in the Hatch Court and Stirling Crescent LSP, the *Rawlinsons Australian Construction Handbook* has been referred to. The 2026 Q1 cost data indicate the following building cost rates for relevant uses:

- Single storey industrial / warehouse: ranging from $1,040/sqm to $1,590/sqm across letting type and owner occupation including low bay and high bay construction;
- Multi-storey ancillary office / amenities: $2,670-$2,875/sqm depending on different building standards;
- One-storey project house: $1,760-$2,045/sqm from basic to medium standard;
- One-storey individual house: $2,545-$3,205/sqm on average for medium standard;
- Two-storey townhouse: $2,890-$3,115/sqm on average for medium standard.

For the Hatch Court industrial precinct, a 10% on the total GFA has been assumed for ancillary offices and amenities, with the remaining being a mix of industrial and warehouses, including low bay and high bay for both letting and owner occupation. This averages $1,435/sqm.

For the Stirling Crescent residential precinct, most of the lots are assumed to be developed into single storey detached houses, with a small portion of up to 10% assumed to be two storeys. An average of 140 sqm GFA has been assumed per dwelling, plus 35 sqm garage, totalling 175 sqm per dwelling. This indicates an average cost of $343,000 per dwelling.

Applying these building costs to the estimated yield within the LSP, this indicates an estimated construction investment of approximately $175.6-$213.1 million should the LSP be fully developed.

Additionally, the City indicated preliminary infrastructure cost of approximately $2 million to up to $6 million for construction of roads, wetlands and other enabling civil infrastructure.

Including both construction of infrastructure and developments, this amounts to a total of $177.6-$219.1 million of estimated construction investment.

Table 2.1 Estimated Construction Investment

Use	Estimated Yield	Average Cost Rate	Total Estimated Cost
Industrial	94,908-118,635 sqm	$1,435/sqm	$136.1-$170.2 M
Residential	115-125 dwellings	$343,000/dwelling	$39.4 -$42.9 M
Infrastructure	-	-	$2.0-$6.0 M
Total	**-**	**-**	**$177.6-$219.1 M**

Source: City of Kalamunda, Rawlinsons Australian Construction Handbook (2026), Macroplan

The initial construction investment will translate into a first round of benefits, realised as increased construction output and employment during the construction phase.

Output multipliers derived from the ABS I-O tables are used for estimating potential economic output of the future development within the construction sector. Output multipliers indicate every $1 of construction investment is likely to generate another approximately $1.2 production-induced indirect economic output and $0.8 consumption-induced indirect output during the construction phase.

The production-induced impacts include the amount of output required within other industries throughout the economy to support the initial construction investment. This may include the following:

- Manufacturing (e.g. building material manufacturing),
- Professional, scientific and technical services (e.g. professional / technical services in planning, design and other services),
- Financial and insurance services (e.g. project financing services),
- Transport, postal and warehousing (e.g. storing and transporting building materials),
- Wholesale trade (e.g. building materials trade),
- Rental, hiring and real estate services,
- Administrative and support services (e.g. government / Council's supporting services, development assessment and approvals), and
- Other industries.

The consumption-induced impacts include the amount of output required within other industries in the economy to support the commodities and services that are spent by workers to produce the initial investment and output. This may include the follows:

- Health care and social assistance (e.g. healthcare and social assistance required for construction workers),
- Public administration and safety (e.g. government / Council's supporting services for everyday living),
- Financial and insurance services (e.g. financial and insurance for construction workers)
- Manufacturing (e.g. manufacturing of daily goods),
- Professional, scientific and technical services (e.g. various population-based services),

- Education and training (e.g. education and training required for construction workers' qualifications and skills),
- Retail trade (e.g. daily goods shopping),
- Transport, postal and warehousing (e.g. transport / daily commuting of construction workers), and
- Other industries.

Based on the output multipliers of the construction sector, the initial construction investment of $177.6-$219.1 million for the potential development in the LSP is likely to create another $220.8-$272.3 million production-induced indirect output and $140.8-$173.6 million consumption-induced output elsewhere in the wider economy, totalling $539.2-$665.1 million construction output (including direct and indirect) to the economy during the construction phase. This is significant compared to the current Gross Regional Product (GRP) of $4,303 million in the City.

It is noted that the I-O multipliers have been adjusted based on location quotients by industry for WA. If building materials and services are sourced locally, it is expected that a large share of this construction output can be captured locally in Greater Perth and WA.

Table 2.2 Estimated Construction Output

Construction Output	Direct	Indirect		Total
$M		Production	Consumption	(D+P+C)
Construction	177.6-219.1	220.8-272.3	140.8-173.6	**539.2-665.1**

Source: ABS 5209, 5220, 5246, City of Kalamunda (2026), Rawlinsons Australian Construction Handbook, Macroplan

The construction of the LSP will also create a significant number of onsite and supporting employment during the construction phase.

Employment multipliers from the ABS I-O tables are used for estimating potential employment effects of the proposed facility during construction phase. Employment multipliers for the construction sector indicate an initial impact at approximately 1.9 construction jobs created per $1 million of investment; plus another 2.5 production-induced indirect jobs and 2.4 consumption-induced indirect jobs elsewhere in the economy during the construction phase. All jobs reported in the ABS I-O tables are measured as full time equivalent (FTE).

Similarly, both the production and consumption-induced employment involves the additional jobs required in other industries throughout the economy to support the initial construction investment and the commodities and services spent by workers.

Based on employment multipliers, the construction of the infrastructure and developments in the LSP is expected to generate approximately 335-414 direct construction FTE jobs on site, plus another 451-556 production-induced indirect FTE jobs and 425-524 consumption-induced indirect FTE jobs elsewhere in the economy, totalling 1,211-1,494 construction related FTE jobs during the construction phase.

Table 2.3 Estimated Construction Employment

Construction Employment	Direct	Indirect		Total
FTE		Production	Consumption	(D+P+C)
Construction	335-414	451-556	425-524	**1,211-1,494**

Source: ABS 5209, 5220, 5246, City of Kalamunda (2026), Macroplan

2.3 Ongoing Employment and Economic Output

As the developments move into operational phase upon completion, it is expected to support ongoing direct and indirect employment at the subject and in the wider economy.

Given the early stage of the LSP and uncertainty of the types of tenants / occupiers of the floorspace, the current industrial employment mix in Forrestfield / High Wycombe has been referred to and benchmarked against. It indicates the tenants / occupiers of the industrial floorspace in the Forrestfield / High Wycombe industrial precinct are anchored by transport, postal and warehousing, manufacturing and construction, followed by wholesale trade, mining and other services (i.e. repair and maintenance), and supplemented by business services, professional services and other supporting services.

For each of these industries, the following average employment densities have been applied based on the *City of Sydney Floor Space and Employment Survey 2022* and other industry employment density guides:

- Mining: around 85 sqm of internal area per worker,
- Manufacturing: around 50 sqm of internal area per worker,
- Electricity, gas, water and waste services: around 45 sqm of internal area per worker,
- Construction: around 85 sqm of internal area per worker,
- Wholesale trade: around 90 sqm of internal area per worker,
- Transport, postal and warehousing: around 150 sqm of internal area per worker,
- Information media and telecommunications: around 35 sqm of internal area per worker,
- Professional, scientific and technical services: around 20 sqm of internal area per worker, and
- Other services: around 45 sqm of internal area per worker.

This results in a weight average employment density of approximately 94 sqm of internal area per worker for industrial uses in the Hatch Court precinct.

Additionally, another 0.05 FTE jobs per dwelling have been assumed to account for potential home-based businesses to be supported by the residential uses in the Stirling Crescent precinct.

Assuming an average building efficiency of 85% for industrial developments, based on the above average employment densities, this indicates the Hatch Court and Stirling Crescent LSP has the capacity to support around 864-1,079 ongoing FTE jobs on site when fully operational.

This direct employment will flow through the economy, realised as indirect employment growth elsewhere in the economy. Employment multipliers derived from the ABS I-O tables in the relevant industries are used for estimating the indirect employment generation. This indicates the onsite direct employment in the LSP may support another 605-756 production-induced FTE jobs and 766-757 consumption-induced FTE jobs elsewhere in the economy. This totals 2,235-2,792 direct and indirect FTE jobs in the local and regional economy.

Table 2.4 Estimated Ongoing Employment

Ongoing Employment	Direct	Indirect		Total
FTE		Production	Consumption	(D+P+C)
Mining	61-76	25-31	48-60	**133-167**
Manufacturing	159-198	79-98	106-132	**343-429**
Electricity, Gas, Water & Waste Services	30-37	40-50	38-47	**107-134**
Construction	134-167	142-178	160-201	**437-546**
Wholesale Trade	77-97	82-103	93-116	**252-315**
Transport, Postal & Warehousing	294-367	193-241	244-306	**731-914**
Information Media & Telecommunications	5-6	4-6	8-11	**18-22**
Professional, Scientific & Technical Services	31-39	21-26	26-33	**78-98**
Other Services	68-85	18-22	39-49	**125-156**
Home based businesses	~6	~2	3-4	**11-12**
Total	**864-1,079**	**605-756**	**766-957**	**2,235-2,792**

Source: ABS, City of Kalamunda (2026), City of Sydney Floor Space and Employment Survey (2022), Macroplan

With the ongoing employment operating onsite in the LSP, this will generate ongoing direct economic output in relevant industries, which will further translate into flow-on impacts in other industries throughout the economy. Based on the output multipliers derived from the ABS I-O tables in the relevant industries, it is estimated that the future onsite employment may create approximately $354.8-$443.3 million direct economic output per annum. The direct economic output will further create another $278.9-$348.5 million production-induced indirect output and $253.6-$316.8 million consumption-induced indirect output per annum elsewhere in the economy. This totals $887.2-$1,108.6 million direct and indirect economic output per annum.

Table 2.5 Estimated Ongoing Output

Ongoing Output	Direct	Indirect		Total
$M		Production	Consumption	(D+P+C)
Mining	17.9-22.4	10.0-12.5	15.9-19.9	**43.8-54.8**
Manufacturing	46.3-57.8	33.0-41.3	35.0-43.8	**114.3-142.9**
Electricity, Gas, Water & Waste Services	15.7-19.6	19.5-24.4	12.4-15.5	**47.6-59.5**
Construction	82.1-102.6	73.5-91.8	53.1-66.4	**208.7-260.9**
Wholesale Trade	47.4-59.3	42.5-53.1	30.7-38.4	**120.6-150.8**
Transport, Postal & Warehousing	115.7-144.7	80.8-101.1	81.0-101.2	**277.6-346.9**
Information Media & Telecommunications	3.1-3.9	2.1-2.6	2.8-3.5	**8.0-10.0**
Professional, Scientific & Technical Services	12.4-15.5	8.7-10.8	8.7-10.8	**29.7-37.2**
Other Services	13.0-16.3	8.2-10.2	12.9-16.1	**34.1-42.6**
Home based businesses	1.1-1.2	0.7-0.8	1.1-1.2	**2.9-3.1**
Total	**354.8-443.3**	**278.9-348.5**	**253.6-316.8**	**887.2-1,108.6**

Source: ABS, City of Kalamunda (2026), Macroplan

2.4 Residents and Expenditure

The residential uses in the Stirling Crescent precinct will provide additional housing supply with increased density to the local area. Based on the current dwelling occupancy of 93.6% and average household size of 2.5 persons in the High Wycombe Statistical Area Level 2 (SA2) as at the 2021 Census, the estimated dwelling yield in the Stirling Crescent precinct has the capacity to accommodate approximately 269-292 residents upon completion.

Based on the average consumption expenditure of $54,082 per capita per annum across Greater Perth, it is estimated these residents living in the precinct may generate up to $14.5-$15.8 million consumption expenditure per year. This includes expenditure in food, liquor and grocery, food catering, apparel retail, household goods, leisure, general retail, retail services and other services, most of which are likely to be contained in the local area.

Table 2.6 Estimated Residents and Expenditure

Dwelling Yield	Households Accommodated	Residents Accommodated	Total Consumption Expenditure
#	#	#	$M
115-125	108-117	269-292	14.5-15.8

2.5 Rates Revenue

The improved land use for industrial and residential developments in the Hatch Court and Stirling Crescent LSP will generate increased rates revenue for the City.

The City applies differential rating categories on gross rental value (GRV). The GRV is the total annual rent a property might reasonably be expected to earn each year if it was rented out. This includes associated rates, taxes, charges, insurances, and other outgoings. The GRV is determined by the Valuer-General for all rateable and leviable properties in WA. The valuation assessment is conducted every 3 years for the metropolitan area.

The City indicated that the total current rates revenue collected from the existing properties within the LSP is $126,141.86 in the financial year.

To estimate the likely rates revenue to be generated from the developments in the LSP, the current industrial and residential market rents have been referred to:

- The *Perth Industrial Market Dynamics* Q1 2026 released by Jones Lang LaSalle (JLL) indicates average net rent of $150/sqm per annum for industrial properties in Perth. Assuming 25% allowance for outgoings and other associated charges, this translates into an estimated gross rent of $200/sqm per annum.
- SQM Research indicates the current average weekly rent for houses in High Wycombe is $729 per week as of week ending 20 May 2026. This amounts to an annual gross rent of $38,012 per dwelling.

It is noted that the above assumptions have been made for analysis purposes. The actual GRV is subject to valuation undertaken by the Valuer-General.

Applying the current rate in dollar set by the City to the above estimated rental values, it is estimated that the future developments in the LSP may generate approximately $1.7-$2.1 million industrial and residential rates revenue per annum. This is an increase of approximately $1.6-$2.0 million per annum in rates revenue for the City.

With the ongoing price appreciation and potential increase in rate in dollar, the likely rates revenue to be generated by the development in the LSP upon completion is expected to be higher than the above estimates.

Table 2.7 Estimated Rates Revenue

Uses	Estimated GRV $ p.a.	Rate in Dollar	Estimated Rates Revenue $ p.a.
Industrial	16,134,360-20,167,950	0.087115	1,404,545-1,756,931
Residential	4,371,396-4,751,518	0.070124	306,540-333,195
Total			**1,712,085-2,090,126**
Net Increase			**1,585,943-1,963,985**

2.6 Broader Economic, Social and Community Impacts

In addition to the quantified economic benefits outlined above, the potential development of the LSP is expected to deliver several economic, social and community benefits to local area and wider regions.

Some key benefits are summarised as follows:

- The potential industrial and residential developments in the LSP will transform underutilised land into productive land for employment uses and additional housing supply.
- The proposed land uses in the LSP align with the strategic directions of the overarching policy (such as the *Perth and Peel @ 3.5 Million*) and the purposes of current zoning.
- The construction and ongoing operation of the LSP will support increased investment and economic activities in various industries at local and regional levels, leveraging its strategic location adjacent to major transport hub and existing industrial precincts.
- The industrial land use will provide much-needed developable industrial land and floorspace to the currently extremely constrained market, supporting continuous business expansion and increasing industrial activities. The lot sizes in the Hatch Court precinct are generally smaller than those in the Perth Airport / Hazelmere precinct. These smaller industrial lots are currently sought after in the market, and also present differentiated offerings to meet diverse market needs.
- Being located with immediate access to major transport infrastructure and existing industrial precincts also stimulates interaction and synergy effect with existing uses, promoting industrial clustering, diversification and productivity.
- The development of the LSP will create additional employment opportunities both during construction and upon completion, enhancing the long-term employment sustainability with further improved employment self-sufficiency and self-containment in the area.
- The industrial uses in the Hatch Court precinct will provide ongoing long-term employment in various sectors including transport and logistics, manufacturing, construction, trades, and repairs and maintenance at a local level, which may also involve apprenticeships, skilled trades and training and technical support opportunities. This will provide local residents and the regional workforce with potential pathways for training, upskilling and career development.

- The indirect social benefits of increased employment opportunities involve broader improvements in wellbeing, stability and social outcomes for individuals, households and community, which lies beyond the direct benefits to the employees supported by a specific project or investment. The indirect social benefits of increased employment opportunities are well documented, and this may include improved financial stability for individuals, families and households, reduction in unemployment and underemployment, reducing social disadvantage, population retention and stability, increased expenditure on local services and facilities, improved mental health and wellbeing, improved community engagement and social cohesion, and decrease in crime rates, etc.

- The residential uses in the Stirling Crescent precinct will provide much-needed additional housing supply amid current nationwide housing shortage, with increased dwelling density and intensified land use compared to the current large lots.

- By providing housing options close to employment, it will improve access to jobs and therefore improve employment containment and population retention.

- The current concept framework of the LSP with the recommended road access will help mitigate adverse amenity impacts on the Stirling Crescent residential precinct.

- The development of the LSP will assist with the achievement of progressive value uplift and upgraded branding to the wider precinct.

Overall, the proposed industrial and residential uses in the LSP address the current undersupply of both uses and will deliver multiple benefits to the economy and community at both local and regional levels.

Appendix 2 Methodology

The Australian Bureau of Statistics (ABS) publishes the Australian National Accounts: Input-Output (I-O) Tables which provide detailed information about the supply and use of products in the Australian economy and the structure of and inter-relationships between Australian industries.

The ABS I-O Tables can translate into a series of I-O multipliers, including multipliers for economic output, employment, income and industry value added. The I-O multipliers are used as a way to estimate the economic impact of a change in demand for a product or service. They can be used to quantify the flow-on effect of a change in the output of an industry on one or more of imports, income, employment or output on individual industries, or in total. They can also be used to show "first-round" changes, or the aggregate effects once secondary effects have flowed through the system.

As an example, for every $1 investment in the construction sector, multipliers can be utilised to calculate the likely direct and indirect impacts on other industries in terms of output, employment, income and/or value added, both production and consumption induced.

The I-O multipliers is a most commonly used tool to quantify the economic impacts (both direct and indirect) relating to policies and projects.

The latest ABS I-O Tables release of FY2022-23 have been used to derive the national I-O multipliers. Further, locational quotients (LQ) based on employment by industry by each State during the same period have been applied, which adjusts the multipliers to a State / regional level.

Appendix 3 Glossary

The following lists a number of glossary of terms relating to an economic impact assessment as indicated by ABS.

Input-output tables provide a detailed dissection of intermediate transactions in an economy, and are thereby a means of describing the supply and use of the products of an entire economic system.

Input-output multipliers are summary measures used for predicting the total impact on all industries in an economy of changes in the demand for the output of any one industry.

Output multipliers for an industry (e.g. construction) are defined as the total value of production by all industries of the economy required to satisfy one extra dollar's worth of final demand for that industry's output.

Employment multipliers correspond to the additional employment (number of persons employed) generated by producing the extra output induced by each of the output effects.

Income multipliers for a given industry are defined as the total value of income from wages, salaries and supplements required to satisfy a dollar's worth of final demand for the output of that industry.

Value added multipliers can be interpreted in the same way as the income multipliers being wages, salaries and supplements plus gross operating surplus required to satisfy a dollar's worth of final demand for the output of an industry.

Initial effects are the initial requirement for an extra dollar's worth of output of a given industry.

First round effects are the amount of output / employment / income / value added required from all industries of the economy to produce the initial one dollar of extra output from an industry.

Industry support effects are the induced output / employment / income / value added from the first round effects (but excluding the first round effect), where the first round output from all industries will induce extra output from all industries, and in turn, these will induce extra output, and so on.

Production-induced effects are the amount of output / employment / income / value added required from all industries of the economy to produce the initial one dollar of extra output and all the subsequent induced output. Production-induced effects include the total of first round effects and industry support effects.

Consumption-induced effects means, to produce the initial and the production-induced output, wage and salary earners will earn extra income which they will spend on commodities produced by all industries in the economy and this spending will induce further production by all industries, where the output / employment / income / value added resulting from this further induced production is the consumption-induced effects.

Total multipliers are the total amount of output / employment / income / value added induced by the requirement from all industries to produce output to satisfy the demand for an extra dollar of output from an industry, and by the spending of the extra wages and salaries earned (from producing the additional output) by householders (consumers). The total multipliers include initial effects, production-induced effects (which include first round effects and industry support effects), and consumption-induced effects.

Appendix 4 Limitations

The following provides a summary of the limitations of I-O multipliers approach for an economic impact assessment as indicated by ABS.

I–O multipliers are most commonly used to quantify the economic impacts (both direct and indirect) relating to policies and projects.

While their ease of use makes I–O multipliers a popular tool for economic impact analysis, they are based on limiting assumptions that results in multipliers being a biased estimator of the benefits or costs of a project.

Inherent shortcomings and limitations of multipliers for economic impact analysis include:

Lack of supply–side constraints: The most significant limitation of economic impact analysis using multipliers is the implicit assumption that the economy has no supply–side constraints. That is, it is assumed that extra output can be produced in one area without taking resources away from other activities, thus overstating economic impacts. The actual impact is likely to be dependent on the extent to which the economy is operating at or near capacity.

Fixed prices: Constraints on the availability of inputs, such as skilled labour, require prices to act as a rationing device. In assessments using multipliers, where factors of production are assumed to be limitless, this rationing response is assumed not to occur. Prices are assumed to be unaffected by policy and any crowding out effects are not captured.

Fixed ratios for intermediate inputs and production: Economic impact analysis using multipliers implicitly assumes that there is a fixed input structure in each industry and fixed ratios for production. As such, impact analysis using multipliers can be seen to describe average effects, not marginal effects. For example, increased demand for a product is assumed to imply an equal increase in production for that product. In reality, however, it may be more efficient to increase imports or divert some exports to local consumption rather than increasing local production by the full amount;

Absence of budget constraints: Assessments of economic impacts using multipliers that consider consumption-induced effects (type two multipliers) implicitly assume that household and government consumption is not subject to budget constraints.

No allowance for purchasers' marginal responses to change: Economic impact analysis using multipliers assumes that households consume goods and services in exact proportions to their initial budget shares. For example, the household budget share of some goods might increase as household income increases. This equally applies to industrial consumption of intermediate inputs and factors of production.

Not applicable for small regions: Multipliers that have been calculated from the national I–O table are not appropriate for use in economic impact analysis of projects in small regions. For small regions multipliers tend to be smaller than national multipliers since their inter–industry linkages are normally relatively shallow. Inter–industry linkages tend to be shallow in small regions since they usually don't have the capacity to produce the wide range of goods used for inputs and consumption, instead importing a large proportion of these goods from other regions.
